Abstract: Distributions of pack ice in the Okhotsk Sea off Hokkaido were observed using a sea-ice radar network at every 0900 JST (Japanese Standard Time) during the whole sea-ice season. Time series of daily ice distributions during the period from 17 January to 21 April 2000 are shown in Fig. 1. In addition, pictures of radar images were taken at every three-hour interval throughout the whole sea-ice season for further studies in coastal sea-ice dynamics and movements. Time series of the daily ice concentration within about 50-km radar coverage from the coastline during the period from 1969 through 2000 is shown in Fig. 2. It appears that the daily ice concentration and period of the ice season decreased drastically since 1989.
