Abstract. Scattering of two 1-dimensional traveling pulses in reaction-diffusion systems is discussed. A variety of scattering dynamics can be observed in a three-component reaction-diffusion systems and the output changes depending on parameters in a sensitive way. It is found numerically that repulsion and annihilation dynamics can be observed near pitchfork and Hopf bifurcation (PH) points of single pulse for appropriate parameter regime. By using center manifold theory, bifurcation structure for single pulse near PH point is also investigated.

Received May 10, 2005. AMS Subject Classification 35K57 To the contributors of the Fifth East Asia PDE Conference
1 Introduction

Spatially localized moving patterns such as pulses and spots have been observed in reaction-diffusion systems. Such a phenomenon has been observed in experimentally and numerically, for instance, in gas-discharged system [1][3], CO-oxidization process [2], chemical reactions [4][8]. These findings introduce a variety of input-output relations for scattering process such as repulsion, fusion, annihilation and even switch to a chaotic regime depending on a parameter regime. A new viewpoint was introduced in [9] to shed a light on the mathematical mechanism controlling them, namely hidden saddles (called “scattor” in [10]) play a key role of traffic control for flows during scattering process.

A typical manner of collision is depicted as in Fig.3. A feature for this scattering is that there is a moment that solution profile right after the collision becomes almost symmetric and close to that of standing pulse as in Fig.3. Intuitively repulsion should persists for nearby parameters, however a tiny change of the parameter $k_4$ causes a sudden change to annihilation like Fig.3 (b-c), which does not look like a strong interaction. How do we understand this transition and what is the mathematical mechanism behind these scattering dynamics? It turns out that singularities of standing pulse of higher codimension are responsible for producing such dynamics.

In this article, we employ the following three-component system as an representative model for our purpose [11].

\[
\begin{align*}
\frac{\partial u}{\partial t} &= D_u u_{xx} + k_2 u - u^3 - k_3 v - k_4 w + k_1, \\
\frac{\partial v}{\partial t} &= D_v v_{xx} + u - \gamma v, \\
\frac{\partial w}{\partial t} &= D_w w_{xx} + u - w. \\
\end{align*}
\]

where $D_u = 5.0 \times 10^{-5}$, $D_v = 6.5 \times 10^{-3}$, $D_w = 1.0 \times 10^{-2}$, $\gamma = 8.0$, $k_1 = -3.0$, $k_2 = 2.0$, $k_3 = 2.0$, $\theta = 10.0$. We adopt $\Delta x = 5.0 \times 10^{-3}$ and $\Delta t = 1.0 \times 10^{-3}$.

2 Scattering dynamics near singularities

We consider the case in which the velocity of traveling pulses is small, namely two traveling pulses approach slowly. This typically occurs near pitchfork bifurcation from standing pulse. Such pitchfork bifurcation can be found for (1) when $k_4$ is increased with $\tau = 1200$ in which traveling pulses emanate from the standing pulse at $k_4 \approx 2.973$ supercritically. A collision of two slow pulses, for instance at $k_4 = 2.978$, is expected like Fig.2, in fact it was shown by [6] that pulses bifurcating supercritically from a stable standing pulse repel at collision. It turns out, however that this is not always the case, especially when the pitchfork bifurcation is combined with Hopf bifurcation.

A numerics reveals that the outputs after scattering are classified as in Fig.1. Solid and dashed lines represent pitchfork and Hopf instabilities respectively emanating from the branch of standing pulse. They intersect at one point PH forming a codim-2 point.

There is no traveling pulse in the left part of the pitchfork bifurcation line, in fact we only observe background state (region I) and standing pulse (region II) there. As shown in Fig.1, it is clear that PH is a kind of organizing center for the classification of outputs. When $\tau$ is below PH, standing pulses change into stable traveling ones as $k_4$ is
Figure 1: Phase diagram for (1). Solid (dashed) line indicates pitchfork (Hopf) bifurcation line for $D_v = 0.00065$. I: Background state. II: Existence region of stable standing pulse. III: Repulsion after collision. IV: Annihilation after collision.
increased, and repulsion of pulses is observed in region III. On the other hand, when \( \tau \) is above PH, the same pitchfork bifurcation occurs as before, however there are no stable traveling pulses when \( k_4 \) is located near the bifurcation point. As \( k_4 \) is still increased, stable traveling pulses of finite speed appear, but the annihilate each other upon collision in region IV. Finally repulsion occurs for larger \( k_4 \) in region III. It should be noted that the speed of traveling pulse near PH of region IV is very slow.

\[ u_t = Du_{xx} + F(u, k) \]

where \( u = (u_1, u_2, \ldots, u_N) \in \mathbb{R}^N \), \( F : \mathbb{R}^N \rightarrow \mathbb{R}^N \) is a smooth function, \( D \) is a diagonal matrix with non-negative elements, and \( k = (k_1, k_2) \in \mathbb{R}^2 \) are bifurcation parameters.

Let \( \mathcal{L}(u; k) := Du_{xx} + F(u, k) \) and \( \kappa = \kappa + \eta = (\kappa_1 + \eta_1, \kappa_2 + \eta_2) \), then we have

\[ u_t = \mathcal{L}(u) + \eta \cdot g(u) \]  

where \( \mathcal{L}(u) = \mathcal{L}(u; \kappa), g(u) = g(u; \eta), \eta \cdot g(u; \eta) = \mathcal{L}(u; \kappa + \eta) - \mathcal{L}(u), \eta = (\eta_1, \eta_2), g(u) = (g_1(u), g_2(u)) \). We assume

3 Reduction to ODEs for a single pulse dynamics

In this section, we give a formal derivation of ODEs under some assumptions in order to describe the dynamics of single pulse near pitchfork and Hopf bifurcation points in a general setting as in [5].

Let us consider the following general form of an \( N \)-component reaction-diffusion equation.

\[ u_t = Du_{xx} + F(u, k) \]
Figure 3: Scattering dynamics for $\tau = 1262.5$. (a) $k_4 = 2.956$. (b) $k_4 = 2.96$. (c) $k_4 = 2.97$. (d) Snapshots when the distance between two pulses attains minimum. Solid line: $t \approx 14700$ ((a)). Dashed line: $t \approx 13000$ ((b)). Dotted line: $t \approx 10480$ ((c)).
There exist $k = \tilde{k} = (\tilde{k}_1, \tilde{k}_2)$ where pitchfork bifurcation and Hopf bifurcation occur, and a stationary pulse solution $S(x)$ of (2) such that $L(S(x); \tilde{k}) \equiv 0$ and $S(-x) = S(x)$.

Let $L = L'(S(x); \tilde{k})$ be the linearized operator of (2) with respect to $S(x)$, and $\Sigma_c$ be the spectrum of $L$.

$\Sigma_c$ consists of $\Sigma_0 = \{0, i\omega_0, -i\omega_0\} (\omega_0 \in \mathbb{R}^+)$ and $\Sigma_1 \subset \{z \in \mathbb{C}; \text{Re}z < -\gamma_0\}$ for some positive constant $\gamma_0$.

$\psi$, $\xi$ are eigenfuctions corresponding to pitchfork bifurcation and Hopf bifurcation respectively. $L\psi = -S_x$ and $L\xi = i\omega_0\xi$ are satisfied, and $\xi$ is even while $\psi$ is odd.

Let $L^*$ be the adjoint operator of $L$. There exist $\phi^*, \psi^*, \xi^*$ such that $L^*\phi^* = 0$, $L^*\psi^* = -\phi^*$ and $L^*\xi^* = -i\omega_0\xi^*$.

By the normalization, $\psi, \xi, \phi^*, \psi^*, \xi^*$ are determined by

$$\langle \psi, S_x \rangle_{L^2} = 0, \quad \langle S_x, \psi^* \rangle_{L^2} = 1, \quad \langle \psi, \psi^* \rangle_{L^2} = 0, \quad \langle \xi, \xi^* \rangle_{L^2} = 1.$$
Substituting (3) into (2), and taking the inner product of \( \psi^*, \phi^*, \xi^* \) and both sizes of (2), then we have

\[
\dot{p} = q + (m_{1100} q r + \text{c.c.}) + (m_{1200} q r^2 + \text{c.c.}) + m_{3000} q^3 + m_{0110} q |r|^2 + m_{1001} q \eta_1 + m_{1002} q \eta_2 + \text{h.o.t.}
\]

\[
\dot{q} = g_{1001} q \eta_1 + g_{1002} q \eta_2 + (g_{1100} q r + \text{c.c.}) + g_{3000} q^3 + (g_{1200} q r^2 + \text{c.c.}) + g_{1110} q |r|^2 + \text{h.o.t.}
\]

\[
\dot{r} = i \omega r + h_{0001} \eta_1 + h_{0002} \eta_2 + (h_{0101} r \eta_1 + \text{c.c.}) + (h_{0102} r \eta_2 + \text{c.c.}) + h_{2000} q^2 + h_{0200} r^2 + \text{c.c.} + h_{0110} |r|^2 + \text{h.o.t.}
\]

where

\[
m_{1100} = -\alpha'_{1100}, \quad m_{1010} = -\alpha'_{1010},
\]

\[
m_{3000} = -\langle F''(S) \psi \cdot \zeta_{2000} + \frac{1}{6} F'''(S) \psi^3 + \partial_x \zeta_{2000}, \psi^* \rangle_{L^2},
\]

\[
m_{1200} = -\langle F''(S) \psi \cdot \zeta_{0200} + F''(S) \xi \cdot \zeta_{1100} + \frac{1}{2} F'''(S) \psi \cdot \xi^2 + \partial_x \zeta_{0200} - \alpha'_{1100} \xi_x, \psi^* \rangle_{L^2},
\]

\[
m_{1110} = -\langle F''(S) \xi \cdot \zeta_{1010} + F''(S) \bar{\xi} \cdot \zeta_{1100} + F''(S) \psi \cdot \zeta_{0110} + F'''(S) \psi \cdot \xi \cdot \bar{\xi}
\]

\[+ \partial_x \zeta_{0110} - \alpha'_{1100} \xi_x - \alpha'_{1010} \xi_x, \psi^* \rangle_{L^2},
\]

\[
m_{1001} = -\langle g'_1(S) \psi + \partial_x \zeta_{0001}, \psi^* \rangle_{L^2},
\]

\[
m_{1002} = -\langle g'_2(S) \psi + \partial_x \zeta_{0002}, \psi^* \rangle_{L^2},
\]

\[
g_{1110} = \alpha_{1100}, \quad g_{1010} = \alpha_{1010},
\]

\[
g_{3000} = \langle F''(S) \psi \cdot \zeta_{2000} + \frac{1}{6} F'''(S) \psi^3 + \partial_x \zeta_{2000}, \phi^* \rangle_{L^2},
\]

\[
g_{1200} = \langle F''(S) \psi \cdot \zeta_{0200} + F''(S) \xi \cdot \zeta_{1100} + \frac{1}{2} F'''(S) \psi \cdot \xi^2 + \partial_x \zeta_{0200} - \alpha'_{1100} \xi_x, \phi^* \rangle_{L^2},
\]

\[
g_{1110} = \langle F''(S) \xi \cdot \zeta_{1010} + F''(S) \bar{\xi} \cdot \zeta_{1100} + F''(S) \psi \cdot \zeta_{0110}, \phi^* \rangle_{L^2}
\]

\[
g_{1001} = \langle g'_1(S) \psi + \partial_x \zeta_{0001}, \phi^* \rangle_{L^2},
\]

\[
g_{1002} = \langle g'_2(S) \psi + \partial_x \zeta_{0002}, \phi^* \rangle_{L^2},
\]
\[ h_{2000} = a_{2000}, \quad h_{0200} = a_{0200}, \quad h_{0020} = a_{0020}, \]
\[ h_{0110} = a_{0110}, \quad h_{0001} = a_{0001}, \quad h_{0002} = a_{0002}, \]
\[ h_{2100} = \langle F''(S) \psi \cdot \zeta_{1100} + F''(S) \xi \cdot \zeta_{2000} \rangle + \frac{1}{2} F'''(S) \psi^2 \cdot \xi + \partial_x \zeta_{1100} - a'_{1100} \psi_x, \xi_x \rangle \neq 0, \]
\[ h_{0300} = \langle F''(S) \xi \cdot \zeta_{0200} + \frac{1}{6} F'''(S) \xi^3 \rangle \neq 0, \]
\[ h_{0210} = \langle F''(S) \xi \cdot \zeta_{0110} + F''(S) \xi \cdot \zeta_{2000} \rangle + \frac{1}{2} F'''(S) \xi^2 \cdot \xi, \xi' \rangle \neq 0, \]
\[ h_{0101} = \langle F''(S) \xi \cdot \zeta_{0001} + a'_1(S) \xi, \xi' \rangle \neq 0, \]
\[ h_{0102} = \langle F''(S) \xi \cdot \zeta_{0002} + a'_2(S) \xi, \xi' \rangle \neq 0. \]

We perform a smooth invertible transformation:

\[
\begin{align*}
v &= q + V_{1100} q r + V_{1010} q^{\bar{r}} + V_{1200} q^2 + V_{1020} q^2 r^2 \\
w &= r + W_{0001} \eta_1 + W_{0002} \eta_2 + W_{2000} q^2 + W_{0200} r^2 + W_{0020} r^2 + W_{0110} |r|^2 \\
&\quad + W_{0011} \eta_1 \bar{r} + W_{0012} \eta_2 \bar{r} + W_{2010} q^2 \bar{r} + W_{0120} |r|^2 + W_{0300} r^3 + W_{0030} r^3
\end{align*}
\]

where

\[
\begin{align*}
V_{1100} &= -\frac{g_{1100}}{i \omega}, \quad V_{1010} = \frac{g_{1010}}{i \omega}, \\
V_{1200} &= -\frac{g_{1200} + g_{1100} V_{1100} + h_{0200} V_{1100} + h_{1200} V_{1110}}{2i \omega}, \\
V_{1020} &= \frac{g_{1020} + g_{1010} V_{1010} + h_{0020} V_{1100} + h_{0020} V_{1010}}{2i \omega}, \\
W_{0001} &= \frac{h_{0001}}{i \omega}, \quad W_{0002} = \frac{h_{0002}}{i \omega}, \\
W_{0011} &= \frac{h_{0011} + 2W_{0002} \bar{h}_{0001} + W_{0110} \bar{h}_{0001}}{2i \omega}, \\
W_{0012} &= \frac{h_{0012} + 2W_{0020} \bar{h}_{0020} + W_{0110} \bar{h}_{0002}}{2i \omega}, \\
W_{2000} &= \frac{h_{2000}}{i \omega}, \quad W_{0200} = \frac{h_{0200}}{i \omega}, \quad W_{2000} = \frac{h_{0020}}{3i \omega}, \quad W_{0110} = \frac{h_{1110}}{i \omega}, \\
W_{2010} &= \frac{h_{2010} + 2W_{2000} \bar{g}_{0110} + 2W_{0020} \bar{h}_{2000} + W_{0110} \bar{h}_{2000}}{2i \omega}, \\
W_{0120} &= \frac{h_{0120} + 2W_{0200} \bar{h}_{0030} + 2W_{0020} \bar{h}_{0110} + W_{0110} \bar{h}_{0110} + W_{0110} \bar{h}_{0020}}{2i \omega}, \\
W_{0300} &= -\frac{h_{0300} + 2W_{0020} \bar{h}_{0200} + W_{0110} \bar{h}_{2000}}{2i \omega}, \\
W_{0030} &= -\frac{h_{0030} + 2W_{0020} \bar{h}_{0020} + W_{0110} \bar{h}_{0020}}{4i \omega}
\end{align*}
\]

Substituting (5) into (4), then we have

\[
\begin{align*}
\dot{v} &= G_{1001} \eta_1 v + G_{1002} \eta_2 v + G_{3000} v^3 + G_{1110} |v|^2 \\
\dot{w} &= i \omega w + H_{0101} \eta_1 w + H_{0102} \eta_2 w + H_{2100} v^2 w + H_{0210} w |w|^2
\end{align*}
\]
Let $w = A e^{i \varphi} (A, \varphi \in \mathbb{R})$. (6) can be written as
\begin{align*}
\dot{\varphi} &= \omega_0 + \mu_1' + h.o.t. \\
\dot{v} &= (-\mu_1 + p_{11} v^2 + p_{12} A^2) v + h.o.t. \\
\dot{A} &= (-\mu_2 + p_{21} v^2 + p_{22} A^2) A + h.o.t.
\end{align*}

where $p_{11} = \text{Re} G_{3000}$, $p_{12} = \text{Re} G_{1110}$, $p_{21} = \text{Re} H_{2100}$, $p_{22} = \text{Re} H_{0210}$. $\mu_1 = -\text{Re} G_{1001} \eta_1 - \text{Re} G_{1002} \eta_2$, $\mu_2 = -\text{Re} H_{0101} \eta_1 - \text{Re} H_{0102} \eta_2$, $\mu_1' = -\text{Im} H_{0101} \eta_1 - \text{Im} H_{0102} \eta_2$

We consider bifurcation diagram of truncated equations of (7) near PH-point. Since the second and third equations of (7) are independent of $\varphi$, the bifurcation diagram is determined by
\begin{align*}
\dot{v} &= (-\mu_1 + p_{11} v^2 + p_{12} A^2) v, \\
\dot{A} &= (-\mu_2 + p_{21} v^2 + p_{22} A^2) A.
\end{align*}

We assume $p_{ij}$ satisfy the following:

\begin{align*}
p_{12}/p_{22} > 0, \quad p_{21}/p_{11} > 0, \quad p_{12}p_{21}/p_{11}p_{22} < 1, \quad p_{11} < 0.
\end{align*}

**Remark 3.1** (9) can be checked numerically for (1).

$(v, A) = (0, 0)$ is a trivial equilibrium point for all $\mu_1$ and $\mu_2$. Equilibria $EP_1^{\pm} : (v, A) = (0, \pm \sqrt{\frac{\mu_2}{p_{22}}})$ bifurcate at the bifurcation line $\mu_1 = 0$ and $EP_2^{\pm} : (v, A) = (\pm \sqrt{\frac{\mu_1}{p_{11}}}, 0)$ bifurcate at the bifurcation line $\mu_2 = 0$. There also exist equilibria $EP_3^{\pm, \pm} : (v, A) = \left(\pm \sqrt{\frac{-p_{12} \mu_2 + p_{22} \mu_1}{p_{11} p_{22} - p_{12} p_{21}}}, \pm \sqrt{\frac{-p_{21} \mu_1 + p_{11} \mu_2}{p_{11} p_{22} - p_{12} p_{21}}} \right)$. $EP_3^{\pm, \pm}$ bifurcate at the line $T_1 = \{(\mu_1, \mu_2) | \mu_1 = \frac{p_{12}}{p_{22}} \mu_2, \mu_2 > 0\}$. 

where
\begin{align*}
G_{1001} &= g_{1001} + V_{1100} h_{0001} + V_{1010} \tilde{h}_{0001}, \\
G_{1002} &= g_{1002} + V_{1100} h_{0002} + V_{1010} \tilde{h}_{0002}, \\
G_{3000} &= g_{3000} + V_{1100} h_{2000} + V_{1010} \tilde{h}_{2000}, \\
G_{1110} &= g_{1110} + V_{1100} g_{1101} + V_{1100} h_{0110} + V_{1010} g_{1100} + V_{1010} \tilde{h}_{0110}, \\
H_{0101} &= h_{0101} + 2W_{0200} h_{0001} + W_{0110} \tilde{h}_{0001}, \\
H_{0102} &= h_{0102} + 2W_{0200} h_{0002} + W_{0110} \tilde{h}_{0002}, \\
H_{2100} &= h_{2100} + 2W_{2000} g_{1100} + 2W_{0200} h_{2000} + W_{0110} \tilde{h}_{2000}, \\
H_{0210} &= h_{0210} + 2W_{0200} h_{0110} + 2W_{0020} h_{0200} + W_{0110} \tilde{h}_{0200} + W_{0110} \tilde{h}_{0110}.
\end{align*}
and

\[ T_2 = \{(\mu_1, \mu_2) | \mu_2 = \frac{p_{21}}{p_{11}} \mu_1, \mu_1 < 0\}. \]

Since \( q \) is velocity of single pulse, solution with \( q \neq 0 \) \((v \neq 0)\) is corresponding to traveling pulse. By changing \((\mu_1, \mu_2)\) like \( 6 \rightarrow 1 \rightarrow 2 \) \((6 \rightarrow 5 \rightarrow 4)\) in Fig.4 we have bifurcation diagram as shown in Fig.5.

Figure 4: Phase portrait of (8) with (9) ([7]). There exist stable standing pulse solutions (stable traveling pulse solutions) for parameters in region 1 and region 2 (region 3 and region 4). The basin size of stable traveling pulse solution shrinks by taking parameters near \( T_2 \). Loosely speaking the transition from region III to region IV in Fig.1 is caused by the shrinkage of the basin size.
