Abstract

Jeju Island, being located off southwestern coast of the Korean Peninsula, is the largest volcanic island in Korea. The marine environment around Jeju Island is highly complicated, and provides affluent biodiversity of fishes. A new list of the fishes of Jeju Island, including a total of 665 species, is given on the bases of both 348 voucher specimens and the related references to the ichthyofauna of Jeju Island.

Key words: Jeju Island, Korea, Fishes, Species list, 665 species

Introduction

Jeju Island, being located off southwestern coast of the Korean Peninsula, is the largest volcanic island of Korea, and is regarded as a depository of marine and terrestrial living organisms owing to its affluent biodiversity. Although the coastal line of the island is relatively monotonous and the depths of its surrounding waters are shallow, less than 150 m, the littoral regions of Jeju Island show diverse marine environments comprising seaweeds, reefs which are well developed in shallow waters, sandy beaches, and soft corals. Especially, the marine environment of Jeju Island is highly complicated, because it is affected not only by several different ocean currents and water masses, such as Tsushima Current divided from the Kuroshio Warm Current, Yellow Sea Cold Water, South Sea Coastal Water, and China Coastal Water, but also by freshwater from springs spouting out near the coastal line and rainwater in rainy season (Choi et al., 1992). It has been known that the coastal waters of Jeju Island play important roles as spawning, feeding, and nursery grounds for variety of marine fishes.

Regarding the ichthyofauna of Jeju Island and its adjacent waters, Uchida and Yabe (1939) firstly reported 162 species, and Kim and Lee (1994) have reported 418 species including freshwater fishes on the basis of specimens and literatures. Yoo et al. (1995), subsequently,

have presented a fish list including 501 species, although some species on their list were based on underwater photographs. Remarkable recent increase of the species recorded in the waters of Jeju Island may be resulted not only by increase of comprehensive collecting efforts, but also by changes of marine environments of the island including gradual rise in water temperature.

In the present paper, we provide a new list of the fishes (including freshwater fishes) of Jeju Island, with a total of 665 species, based on both 350 voucher specimens and the references related to the ichthyofauna of Jeju Island.

Materials and Methods

The species list was made on the basis of both voucher specimens and reliable references related to the ichthyofauna of Jeju Island, Korea. The systematic arrangements of the families follow those of Nelson (2006). Scientific names are generally those of Kim et al. (2005) with some modifications by recent taxonomic works. Species in each family are arranged in an alphabetical order of species names. Standard Korean names for most species are the romanized names of those in Kim et al. (2005) following the Hangeul Romanization Notation for the Korean alphabet restoration, and are given in brackets after the scientific name. Standard Japanese names are also given, following Korean names. About

half of the species included in this list are based on the voucher specimens, but for the species without voucher specimens, only the reference of the first Korean report for the species and scientific name used in it are given. Voucher specimens given in this paper are tentatively deposited in the Marine and Environmental Research Institute, Cheju National University, Korea (MRIC), except for some specimens registered in KNUM (Faculty of Marine Life Science, Kunsan National University, Korea).

Acknowledgments

This study is partly supported by Core University Program on Fisheries Sciences between Korea and Japan, granted by KOSEF (Korea Science and Engineering foundation) and JSPS (Japan Society of the Promotion of Science). We also give our sincere thanks to the members of present Core University Program: Drs. Keiichi Matsuura and Gento Shinohara (National Museum of Nature and Science, Japan), Drs. Kunio Sasaki and Hiromitsu Endo (Kochi University, Japan), Dr. Kazumi Hosoya (Kinki University, Japan), and to Drs. You-Bong Go, and Young-Don Lee including the members of the Marine and Environmental Research Institute (Cheju National University, Korea), Dr. Jin-Koo Kim, Jeong-Ho Park and Hyuk-Jun Kweon (Pukyung National University, Korea), Drs. Dae-Soo Chang, Wan-Ok Lee, Jung-Hwa Choi, Joon-Taek Yoo, and Seung-Jong Lee (National Fisheries Research & Development Institute, Korea), and Drs. Jung-Goo Myoung and Sung Kim (Korean Ocean Research and Development Institute) for providing us with various information and collecting fishes.
