Abstract

The deoxyfluorination reaction of β-diketones with *N*,*N*-diethyl- α , α -difluoro-*m*-methylbenzylamine (DFMBA) gave β -fluoro- α , β -unsaturated ketones in good yields. The reaction proceeded regioselectively, and only one regioisomer was obtained from the unsymmetrical 1-aryl-1,3-diketones. The reaction is applicable to diketones with a trifluoromethyl group, obtaining good yields of 3,4,4,4-tetrafluorobutenones. We used the resulting β -fluoro- α , β -unsaturated ketones for the reaction with lithium dialkyl cuprates.

1. Introduction

 β -Fluoro- α , β -unsaturated ketones have been conveniently used as a building-block for

the synthesis of fluorinated cyclic compounds via Diels-Alder reaction [1] and the synthesis of the heterocyclic compounds [2]. The β -fluoro- α , β -unsaturated ketones were previously prepared by the hydrofluorination of alkynyl ketones [3], the alkylation of β -fluoro- α , β -unsaturated carboxylic acid chlorides [4], the alkylation of β,β -difluoro- α,β -unsaturated ketones [5], or the elimination of HF from β , β -difluoroalkyl ketones [2a,b]. However, the starting materials, alkynyl ketones, β -fluoro- α , β -unsaturated carboxylic acid chlorides, β , β -difluoro- α , β -unsaturated ketones, and β , β -difluoroalkyl ketones are not easily available in those methods. The corresponding chlorides, β -chloro- α , β -unsaturated ketones, can be easily prepared from β -diketones with chlorination reagents [6], but the reaction of β -diketones with fluorination reagents such as DAST or deoxofluor gave poly-fluorinated products, so β -fluoro- α , β -unsaturated ketones could not be directly prepared from β -diketones [7]. Recently, we reported the fluorination of alcohols [8], epoxides [9], aldehydes [10], diols [11], and amino alcohols [12] using N,N-diethyl- α,α -difluoro-*m*-methylbenzylamine (DFMBA). During the course of our study of the fluorination reaction using DFMBA, we found that β -fluoro- α , β -unsaturated ketones 2 can be prepared from β -diketones 1 by the reaction with DFMBA (Scheme 1).

2. Result and discussion

The reaction of undecane-5,7-dione 1a with DFMBA was completed at 30 °C in 24 h and 7-fluoro-6-undecen-5-one 2a was obtained in a 79% yield as a mixture of stereoisomers (E:Z = 73:27) (Entry 1 in Table 1). A two equivalent of DFMBA to **1a** is necessary, and with a smaller amount of DFMBA, the yield of 2a decreased considerably. As for the solvent, 1,4-dioxane, DMF, and CH₂Cl₂ are appropriate and hexane is not suitable hydrocarbon such as for this reaction. When 1-phenylbutane-1,3-dione 1b was used, the deoxyfluorination reaction occurred regioselectively at the carbonyl group of C3 to give 3-fluoro-1-phenyl-2-buten-1-one **2b**, but its regioisomer, 4-fluoro-4-phenyl-3-buten-2-one, did not form (Entry 2). Such regioselectivity was always observed in the reaction with unsymmetrical 1-aryl-1,3-alkadiones ($R^1 = Ar$, $R^2 = H$, $R^3 = alkyl$) (Entries 2, 4-9). In contrast, a poor stereoselectivity of the generated double bond in the products was observed in most of the cases, and mixtures of the stereoisomers were obtained (Entries 1-3, and 5-9). When the diketone **1d** with a bulky substituent ($R^3 = tert$ -Bu) was used, the product (Z)-2d was obtained stereo- and regioselectively (E:Z = 1:99) (Entry 4). The reactions of diketones 1c, 1d and 1i were sluggish and required higher reaction temperatures for completion (Entries 3, 4, and 9). In the reaction of the diketone 1j with an α -substituent, we applied a micro-wave irradiation condition without solvent to optimize the result (Entry 10). This reaction is applicable to the diketones 1e-h with a trifluoromethyl group ($R^1 = Ar$, $R^2 = H$, $R^3 = CF_3$) and 1-aryl-3,4,4,4-tetrafluoro-2-buten-1-ones **2e-h** were obtained in good yields (Entries 5-8). 1-Phenyl-3,4,4,4-tetrafluoro-2-buten-1-one 2e was previously prepared from 1-phenyl-3,3,4,4,4-pentafluorobutan-1-one by elimination of HF, and used as a building-block for the synthesis of various

organofluorine compounds [2a,b]. However, the starting material of our reaction, 1-phenyl-4,4,4-trifluorobutane-1,3-dione **1e**, is commercially available and more accessible than 1-phenyl-3,3,4,4,4-pentafluorobutan-1-one. Therefore, our method is more useful for the synthesis of 1-aryl-3,4,4,4-tetrafluoro-2-buten-1-ones than the previous method. In the reaction of 4-*tert*-butyl-2-acetylcyclohexanone **1j**, a double bond was formed at *exo*-position selectively and 4-*tert*-butyl-2-(1-fluoroethylidene)cyclohexanone **2j** was obtained as a single isomer [13].

The presumed reaction mechanism of the present deoxyfluorination reaction is shown in Scheme 2. The β -diketones **1** exist as an equilibrium mixture of keto and enol forms [14] and DFMBA reacted with the enol form to give the intermediate **3**. From **3**, elimination of the fluoride, attack of the fluoride at the β -carbon, and the elimination of an amide took place successively to give β -fluoro- α , β -unsaturated ketones **2**. In the reaction of unsymmetrical diketones (R¹ = Ar, R³ = alkyl or CF₃), two kinds of enol forms (**A** and **B**) exist, and they could give regioisomers **2** and **2**' via the reaction with DFMBA, respectively. However, in the present deoxyfluorination reaction, only one regioisomer **2** was formed from the unsymmetrical diketones (**1b**, **1d-1i**). In the chlorination of the unsymmetrical β -diketones with Vielsmerer's reagent, the similar regioselectivity was observed and the selectivity was explained by the difference in nucleophilicity of the hydroxy oxygen (A > B: R¹ = Ar, R³ = alkyl) [6]. Therefore, the enol form **A** is more reactive towards DFMBA than **B**, and the reaction proceeded through the intermediate **3** to give product **2** selectively.

β-Halo- [15], β–alkylthio- [15b], and β-acetoxy- α ,β-unsaturated ketones [16] have been used for the reaction with dialkyl cuprates to introduce an alkyl group onto the double bond via the substitution with the hetero atom. β-Fluoro- α ,β-unsaturated ketones were

used for the reaction with dialkyl cuprates for the synthesis of also β , β -dialkyl- α , β -unsaturated ketones [5]. We also applied **2b** and **2e** to the reaction with dialkyl cuprates. The reaction of (E)-2b with Me₂CuLi proceeded at -78 °C and 3-methyl-1-phenyl-2-buten-1-one 4a was obtained in high yield (Entry 1 in Table 2). for However, when Bu₂CuLi was used the reaction with (*E*)-2b, 3-methyl-1-phenyl-2-hepten-1-one 4b was obtained as a mixture of stereoisomers (E:Z = 24:76) (Entry 2). As **4b** was also formed as a mixture of stereoisomers (E:Z = 30:70) in the reaction with (Z)-2b (Entry 3), the reaction of 2b with lithium dialkyl cuprates proceeded non-stereoselectively as reported previously [5].

In the reaction of 1-phenyl-3,4,4,4-tetrafluoro-2-buten-1-one **2e** (a mixture of *E* and *Z* isomers) with Me₂CuLi, the expected product,

(E)-3-methyl-1-phenyl-4,4,4-trifluoro-2-buten-1-one 5a, was obtained as a minor product, and the unexpected 4,4-difluoro-1-phenyl-3-methyl-3-buten-1-one 6a was obtained as a major product. The unexpected product 6a must be formed by the reduction of 5a with the copper reagent [17]. The result was not dependent on the stereochemistry of the starting material 2e, and from pure (Z)-2e, the same result was of obtained. In the reaction **2e** with Bu₂CuLi, 4,4-difluoro-1-phenyl-3-butyl-3-buten-1-one 6b was also obtained in a 64% yield, whereas (E)-3-butyl-1-phenyl-4,4,4-trifluoro-2-buten-1-one 5b was formed as a minor product (8% yield).

3. Conclusion

We performed the reaction of DFMBA with various β -diketones including trifluoro diketones and obtained the β -fluoro- α , β -unsaturated ketones in good yields. The reaction proceeded regioselectively and only one regioisomer was obtained from the unsymmetrical diketones. The resulting β -fluoro- α , β -unsaturated ketones were used for the alkylation reactions with lithium dialkyl cuprates.

4. Experimental

4.1. General

The melting points were measured with a Yanagimoto micro melting-point apparatus. The IR spectra were recorded using a JASCO FT/IR-410. The ¹H NMR (400 MHz) spectra, ¹⁹F NMR (376 MHz) spectra, and ¹³C NMR (100 MHz) were recorded in CDCl₃ on a JEOL JNM-A400II FT NMR and the chemical shift, δ , is referred to TMS (¹H, ¹³C) and CFCl₃ (¹⁹F), respectively. The EI-high-resolution mass spectra were measured on a JEOL JMS-700TZ. DFMBA was donated from Mitubishi Gas Co. Ltd. Microwave irradiation was carried out using an IDX microwave oven for organic synthesis (0-300 W, IMCR-25003) with temperature control.

4.2.7. 3-Fluoro-2-methyl-1-phenyl-2-buten-1-one (2i)

To a TeflonTM PFA tube with a diameter of 10 mm sealed at one end,

2-methyl-1-phenylbutane-1,3-dione 1i (176 mg, 1 mmol) and DFMBA (426 mg, 2 mmol) were introduced. The open end of the tube was connected to a reflux condenser. Then, the reaction mixture was submitted for 30 min to micro-wave irradiation and during the irradiation, the temperature was kept at 90 °C. After cooling, the reaction mixture was poured into sat aq NaHCO₃. The product was extracted with ether (20 mL X 3) and the combined ethereal layer was dried over MgSO₄. Purification by column chromatography (silica gel/hexane-ether) gave 2i (132 mg) in 74% yield as a mixture of stereoisomers (E:Z = 86:14, they are separable by column chromatography); (E)-2i; clear oil: IR (neat): 2926, 1811, 1651, 1284 cm⁻¹. ¹H NMR & 7.86-7.82 (m, 2H), 7.58–7.41 (m, 3H), 2.09 (d, J = 18.4 Hz, 3H), 1.90 (brs, 3H). ¹³C NMR δ 196.42 (d, J =2.2 Hz), 157.98 (d, J = 257.9 Hz), 137.84 (d, J = 1.6 Hz), 132.85, 128.95 (d, J = 1.6 Hz), 2C), 128.35 (2C), 113.01 (d, J = 14.2 Hz), 15.45 (d, J = 29.8 Hz), 14.14 (d, J = 4.2 Hz). ¹⁹F NMR δ –84.38 to –84.75 (m, 1F). HRMS (EI): calcd for C₁₁H₁₁FO (M⁺); 178.0794, found; 178.0792. HRMS (EI): calcd for C₁₂H₁₉FO (M⁺); 198.1420, found; 198.1414.

4.3. Reaction of 2 with dialkyl cuprates

4.3.1. Reaction of 2b with lithium dimethyl cuprate

To a THF solution (5 mL) of CuBr Me₂S (208 mg, 1.01 mmol) was added at 0 °C, 1.6 M ethereal solution of MeLi (1.25 mL, 2 mmol) and the mixture was stirred for 30 min. Then, the mixture was cooled to -78 °C and a THF solution of (*E*)-**2b** (80.2 mg, 0.488 mmol) was added. The mixture was stirred at the temperature for 3 h and quenched by the successive addition of MeOH (5 mL) and sat aq NH₄Cl (10 mL). The mixture was extracted with ether (20 mL X 3) and combined organic layer was washed with brine (20 mL). The organic layer was dried over MgSO₄ and concentrated under reduced pressure. Purification by column chromatography (silica gel/hexane-ether) gave 3-methyl-1-phenyl-2-buten-1-one **4a** (73 mg) in 93% yield; clear oil: IR (neat): 2912, 1660, 1614, 1248, 1011 cm⁻¹. ¹H NMR δ 7.94–7.92 (m, 2H), 7.55–7.43 (m, 3H), 6.76–6.75 (m, 1H), 2.21 (d, *J* = 1.0 Hz, 3H, CH₃), 2.02 (d, *J* = 1.1 Hz, 3H, CH₃) {lit. 4.3.2. Reaction of **2b** *with lithium dibutyl cuprate*

To a THF solution (5 mL) of CuBr Me₂S (208 mg, 1.01 mmol) was added at -45 °C, 1.6 M hexane solution of BuLi (1.25 mL, 2.0 mmol) and the mixture was stirred for 45 min. Then, the mixture was cooled to -78 C and a THF solution of **2b** (80.3 mg, 0.489 mmol) was added. The mixture was stirred at the temperature for 3 h and quenched by the successive addition of MeOH (5 mL) and sat aq NH₄Cl (10 mL). The mixture was extracted with ether (20 mL X 3) and combined organic layer was washed with brine (20 mL). The organic layer was dried over MgSO₄ and concentrated under reduced pressure. Purification by column chromatography (silica gel/hexane-ether) gave 3-methyl-1-phenyl-2-hepten-1-one 4b (81.0 mg) in 82% yield as mixture of the stereoisomers (E:Z = 24:76, they are separable by column chromatography). (Z)-4b; clear oil: IR (neat): 2958, 1661, 1611, 1254 cm⁻¹. ¹H NMR & 7.94-7.92 (m, 2H), 7.54–7.43 (m, 3H), 6.72 (s, 1H), 2.63 (t, J = 7.8 Hz, 2H), 2.01 (d, J = 1.3 Hz, 3H), 1.56–1.35 (m, 4H), 0.93 (t, J = 7.2 Hz, 3H). ¹³C NMR δ 191.23, 160.97, 139.30, 132.19, 128.37 (2C), 128.14 (2C), 121.10, 33.98, 30.40, 25.69, 22.92, 13.95.
