Abstract

Trisubstituted (2-fluoroalkenyl)iodonium salts were prepared *E*- or *Z*-selectively by the reaction of (fluoroalkenyl)iodonium ylides generated from (fluoroalkenyl)iodonium salts with aldehydes.

1. Introduction

Alkenyliodonium salts have been used as a versatile reagent in organic synthesis and many methods have been reported for their synthesis [1]. However, the stereoselective synthesis of acyclic alkenyliodonium salts having a substituent on the same carbon as the iodine is difficult and only few precedent works have been reported for their synthesis [2]. Recently, Ochiai *et al.* succeeded in preparing the (*E*)-isomer of trisubstituted (fluoroalkenyl)iodonium salts stereoselectively by the addition of iodotoluene difluoride to the unsymmetrical internal alkynes [3]. However, their method can't be applied to the synthesis of the corresponding

(*Z*)-isomers. Recently, we succeeded in the stereoselective synthesis of (fluoroalkenyl)boranes by using the unstable (2-fluoroalkenyl)iodonium ylides **2** generated from (2-fluoroalkenyl)iodonium salts **1** by the treatment with LDA [4]. As both (*E*)- and (*Z*)-(2-fluoroalkenyl)iodonium salts can be prepared stereoselectively, the methodology using **2** is considerably promising [5]. We report here the *E*- or *Z*-selective synthesis of trisubstituted (fluoroalkenyl)iodonium salts **3** by the reaction of **2** with aldehydes (**Scheme 1**).

Scheme 1. The reaction of (2-fluoroalkenyl)iodonium ylide **2** with aldehyde

2. Results and discussion

When a THF solution of (*Z*)-(2-fluoro-1-dodecyl)(phenyl)iodonium salt **1a** [6] was treated with LDA in the presence of benzaldehyde at -78°C , a viscous liquid was obtained after a work-up procedure. The ^1H NMR spectra of the viscous liquid showed no vinylic proton, and the ^{19}F NMR spectra showed a singlet peak at -63 ppm. In NOE studies, 5.5%-6.6% interaction was observed between allylic protons and a benzylic proton. From these observations, the product was determined to be (*Z*)-(3-fluoro-1-hydroxy-1-phenyltridec-2-en-2-yl)(phenyl)iodonium salt **3a**. On the other hand, when the (*E*)-isomer of (2-fluoro-1-alkenyl)iodonium salt **1b** [7] was used

in the reaction with benzaldehyde, a product different from **3a** was obtained. In the ^{19}F NMR spectra of this product, a singlet peak appeared at -77 ppm, and in NOE studies, no interaction was observed between allylic protons and a benzylic proton. From these observations, the product obtained from **1b** was determined to be (*E*)-(3-fluoro-1-hydroxy-1-phenyltridec-2-en-2-yl)(tolyl)iodonium salt **3b** (Scheme 2). Therefore, the generated ylides **2a** and **2b** reacted with benzaldehyde to give (*E*)- and (*Z*)-trisubstituted (fluoroalkenyl)iodonium salts **3a** and **3b**, respectively, without losing their original stereochemistry.

Scheme 2. NOE study of (*Z*)- and (*E*)-trisubstituted (fluoroalkenyl)iodonium salts **3a** and **3b**

Both aromatic and aliphatic aldehydes can be used in the reaction, and various hydroxyalkyl groups can be introduced to the vinylic carbon of the (fluoroalkenyl)iodonium salts. Furthermore, multi-functionalized trisubstituted (fluoroalkenyl)iodonium salts (**3e-g**) can be prepared by using functionalized (fluoroalkenyl)iodonium salts (**1c-e**) as the starting material (Entries 5-7, Table 1).

3. Conclusion

The (2-fluoroalkenyl)iodonium ylide generated from 2-(fluoroalkenyl)iodonium salt was shown to be used for the synthesis of the trisubstituted (2-fluoroalkenyl)iodonium salt by the reaction with aldehyde. It was also shown that the reaction proceeds stereoselectively and from (*E*)- and (*Z*)-(2-fluoroalkenyl)iodonium salts, the corresponding (*E*)- and (*Z*)-trisubstituted (fluoroalkenyl)iodonium salts were formed without loss of the original stereochemistry. Introduction of functional group to the product was also performed.

4. Experimental

4.1. General

The IR spectra were recorded using a JASCO FT/IR-410. The ^1H NMR (400 MHz) spectra, ^{19}F NMR (376 MHz) spectra, and ^{13}C NMR (100 MHz) were recorded in CDCl_3 on a JEOL JNM-A400II FT NMR and the chemical shift, δ , is referred to TMS (^1H , ^{13}C) and CFCl_3 (^{19}F), respectively. The EI-high-resolution mass spectra were measured on a JEOL JMS-700TZ. *p*-Iodotoluene difluoride was prepared according to the literature [8]. 1-Alkynyliodonium salts were prepared from 1-alkyne according to the literature [9]. (*Z*)-(2-Fluoro-1-alkenyl)iodonium salts (**1a**, **1c-f**) were prepared from 1-alkynyliodonium salts according to the literature [6]. (*E*)-(2-Fluoro-1-dodecyl)iodonium salt (**1b**) was prepared from 1-dodecyne and *p*-iodotoluene difluoride according to the literature [7].

4.2. General procedure for the reaction of **2** with aldehydes

To a THF solution (6 mL) of (2-fluoroalkenyl)iodonium salt **1** (0.5 mmol) and an aldehyde (0.7 mmol) was added a cooled THF solution (2 mL) of LDA (0.7 mmol) at -78 °C (for (*Z*)-isomer) or at -90°C (for (*E*)-isomer), and the mixture was stirred at -60 °C for 1.5h. After the addition of a 42% aqueous HBF₄ (2 mL), the cooling bath was removed and the mixture was stirred at room temperature for 1h. Then, the product was extracted with ether (10 mL X 3) and the combined organic layer was dried over MgSO₄. After concentration under reduced pressure, the remained viscous liquid was washed with hexane. An upper hexane layer was removed by decantation (this operation was repeated twice). A volatile part was removed under high vacuum to give the (fluoroalkenyl)iodonium salt **3**.
