PARTIALLY ORDERED ABELIAN SEMIGROUPS. IV

ON THE EXTENTION OF THE CERTAIN NORMAL PARTIAL ORDER DEFINED ON ABELIAN SEMIGROUPS

By

Osamu NAKADA

In Part I¹⁾ of this series, I noted that for any two elements x and y non-comparable in the strong partial order P defined on an abelian semigroup S there exists an extension Q of P such $x > y$ in Q if and only if P is normal. In this Part IV, I shall discuss the extension of the partial order under the weak condition than strongness.

Definition 1. A set S is said to be a *partially ordered abelian semigroup* (p.o. semigroup), when S is (I) an abelian semigroup (not necessarily contains the unit element), (II) a partially ordered set, and satisfies (III) the homogeneity: $a \geq b$ implies $ac \geq bc$ for any c of S .

A partial order which satisfies the condition (III) is called a *partial order defined on an abelian semigroup*.

Moreover, if a partial order defined on an abelian semigroup S is a linear order, then S is said to be a *linearly ordered abelian semigroup* (l.o. semigroup).

We write $a // b$ in P for a and b are non-comparable in P .

Definition 2. Let P be a partial order defined on an abelian semigroup S . We consider the following conditions for the partial order P :

(E): $ac > bc$ in P implies $a > b$ in P . (order cancellation law)

(G): Let x and y be any two elements non-comparable in P . Then there exists an extension of P in which $x > y$.

(H): If $a // b$ in P , then $ua \neq ub$ for any u in S .

(K): If $a // b$ in P , then $ua // ub$ in P for any u in S .

(L): Let $a // b$ and $u // v$ in P respectively. If $au \neq bv$, then $au // bv$ in P .

1) Partially ordered abelian semigroup. I. On the extension of the strong partial order defined on abelian semigroups. Journ. Fac. Sci., Hokkaido University, Series I, vol. XI (1951), pp. 181-189.

Strongness : $ac \geq bc$ in P implies $a \geq b$ in P .

Normality : $a^n \geq b^n$ in P for some positive integer n implies $a \geq b$ in P .

Theorem 1. *Let P be a partial order defined on an abelian semigroup S . Then P satisfies the condition (K) if and only if P satisfies the conditions (E) and (H).*

Proof. Clearly the condition (K) implies the condition (H). If P satisfies the condition (K) and $ac > bc$ in P , then a and b are comparable in P . And hence we have $a > b$ in P .

Conversely, let P satisfy the conditions (H) and (E) and let $a // b$ in P . Then we have $ua \neq ub$ for any u in S by the condition (H). If ac and bc are comparable in P for some c in S , say that $ac > bc$ in P , then we have $a > b$ in P by the condition (E), this is impossible.

Theorem 2. *Let P be a normal partial order defined on abelian semigroup S which satisfies the condition (K). If $a // b$ in P , then $u^i a^j // u^i b^j$ in P for any u in S and any integers $i (\geq 0)$ and $j (> 0)$, where if $i=0$, $u^i a^j // u^i b^j$ means that $a^j // b^j$.*

Proof. By the normality, $a // b$ in P implies $a^j // b^j$ in P for any positive integer j . And hence we have $u^i a^j // u^i b^j$ in P by the condition (K).

Theorem 3. *Let P be a normal partial order defined on an abelian semigroup S which satisfies the condition (K) and x and y be any two elements non-comparable in P . Then there exists a normal extension Q of P such that $x > y$ in Q .*

Proof. Let P be a normal partial order defined on S and the elements x and y are not comparable in P . Let us define a relation Q as follows:

We put $a > b$ in Q if and only if $a \neq b$ and there exist two non-negative integers n and m , such that not both zero and

$$(\S) \quad a^n y^m \geq b^n x^m \quad \text{in } P,$$

where if $m=0$ or $n=0$ (§) means that $a^n \geq b^n$ or $y^m \geq x^m$ in P respectively.

First we note that n is never zero, for otherwise we should have $y^m \geq x^m$ in P , whence by the normality we have $y \geq x$ in P against the hypothesis.

(i) We begin with verifying that $a > b$ and $b > a$ in Q are contradictory. Suppose that $a > b$ and $b > a$ in Q , namely $a^n y^m \geq b^n x^m$ and $b^i y^j \geq a^i x^j$ in P for some non-negative integers n, m, i, j . By multiplying i times the first, n times the second inequality, we obtain $(ab)^{ni} y^{mi+nj} \geq (ab)^{ni} x^{mi+nj}$ in P , which contradicts the condition (K). If $m=j=0$, then we have $a > b$ and $b > a$ in P , which is impossible.

(ii) We show the transitivity of Q . Assume that $a > b$ and $b > c$ in Q , i.e., for some non-negative integers n, m, i, j , $a^n y^m \geq b^n x^m$ and $b^i y^j \geq c^i x^j$ in P . By multiplying as in (i) we get $a^{ni} y^{mi+nj} \geq c^{ni} x^{mi+nj}$ in P . Here ni is not zero, and $a=c$ is impossible by the condition (K), so that $a > c$ in Q . If $m=j=0$, then we have $a > b, b > c$ in P , and hence $a > c$ in $P(Q)$.

(iii) We prove next the homogeneity of Q . Suppose that $a > b$ in Q . If $ac \neq bc$, from $(ac)^n y^m \geq (bc)^n x^m$ in P we have $ac > bc$ in Q . Therefore $a > b$ in Q implies $ac \geq bc$ in Q for any c of S .

(iv) Q is an extension of P , for if $a > b$ in P , then $ay^0 > bx^0$ in P , therefore $a > b$ in Q .

(v) It is clear that $x > y$ in Q . In fact, $xy \geq yx$ in P .

(vi) We may prove the normality of Q . Indeed, supposing $a^n > b^n$ in Q for some positive integer n , i.e., $(a^n)^i y^j \geq (b^n)^i x^j$ in P , we see at once that $a > b$ in Q .

(vii) If $a // b$ in Q , then $a // b$ in P , and hence $ua \neq ub$ for any u in S . Therefore, Q satisfies the condition (H).

Theorem 4. Let P be a partial order defined on an abelian semigroup S which satisfies the condition (G) and let $a // b, u // v$ in P . If $au \neq bv$ and $av = bu$, then $au // bv$ in P .

Proof. Suppose that au and bv are comparable in P , say that $au > bv$ in P . There exists an extension Q of P such that $v > u$ in Q . Then we have $bv \geq bu = av \geq au$ in Q , that is, we have $bv \geq au$ in Q . This contradicts the assumption.

Theorem 5. Let P be a partial order defined on an abelian semigroup S which satisfies the condition (G) and let $a // b, u // v$ in P . If $au \neq bv$ and $av \neq bu$, then $au // bv$ or $av // bu$ in P .

Proof. Suppose that au and bv are comparable in P , say that $au > bv$ in P . If $bu > av$ in P , then we consider an extension Q of P such that $v > u$ in Q . Then we have $bv \geq bu > av \geq au$ in Q , that is, $bv > au$ in Q , this is absurd. If $av > bu$ in P , then we consider an extension Q of P such that $b > a$ in Q . Then we have $bv \geq av > bu \geq au$ in Q , that is, $bv > au$ in Q , which leads the contradiction also. Therefore, $bu // av$ in P .

Theorem 6. Let P be a normal partial order defined on an abelian semigroup S which satisfies the condition (K). If $a > b$ and $x // y$ in P , then $a^n y^m > b^n x^m$ or $a^n y^m // b^n x^m$ in P ($a^n x^m > b^n y^m$ or $a^n x^m // b^n y^m$ in P) for any integers $m (\geq 0)$ and $n (> 0)$.

Proof. If $a^n y^m = b^n x^m$ for some positive integers m and n , then we

have $a^n x^m \geq b^n x^m = a^n y^m \geq b^n y^m$ in P , that is, $b^n x^m \geq b^n y^m$ in P which contradicts the condition (K).

By the existence of the extension Q of P such that $y > x$ in Q , we have $a^n y^m \geq b^n x^m$ in Q . Hence, if $a^n y^m$ and $b^n x^m$ are comparable in P , then we have $a^n y^m > b^n x^m$ in P .

Theorem 7. *Let P be a normal partial order defined on an abelian semigroup S which satisfies the conditions (K) and (L) and let $x // y$ in P . For two distinct elements a and b , the following two properties are equivalent to each other:*

- (1) $a > b$ in P or $a^n y^m = b^n x^m$
- (2) $a^n y^m \geq b^n x^m$ in P

for some integers $m (\geq 0)$ and $n (> 0)$, where if $m = 0$, $a^n y^m$ and $b^n x^m$ means that a^n and b^n respectively.

Proof. (1) implies (2): If $a > b$ in P , then we can write $ay^0 \geq bx^0$ in P .

(2) implies (1): If $a // b$ in P , then by the normality we have $m > 0$ and $a^n // b^n$, $y^m // x^m$ in P . Therefore, $a^n y^m = b^n x^m$ by the condition (L).

If $m = 0$, then $a^n \geq b^n$, and hence $a > b$ in P .

If $m > 0$ and $b > a$ in P , then $b^n > a^n$, and hence we have $b^n x^m \geq b^n x^m$, $b^n y^m \geq a^n y^m$ in P . Therefore, we have $b^n y^m \geq a^n y^m \geq b^n x^m \geq a^n x^m$ in P , that is, $b^n y^m \geq b^n x^m$ in P which contradicts the condition (K). Therefore, we have $a > b$ in P .

Moreover, in this case, $a > b$ in P if and only if $a^n y^m > b^n x^m$ in P for some integers $m (\geq 0)$ and $n (> 0)$.

Theorem 8. *Let P be a normal partial order defined on an abelian semigroup S which satisfies the conditions (K) and (L) and x and y be any two elements non-comparable in P . Then there exists a normal extension Q , which satisfies the condition (K), of P such that $x > y$ in Q .*

Proof. By Theorem 3, there exists the normal extension Q of P which satisfies the condition (H) such that $x > y$ in Q .

The order-relation Q is as follows:

$a > b$ in Q if and only if $a > b$ in P , or $a // b$ in P and $a^n y^m = b^n x^m$ for some positive integers m and n .

(viii) Suppose that $ac > bc$ in Q . If $ac > bc$ in P , then we have $a > b$ in $P(Q)$. If $ac // bc$ in P , then $a // b$ in P and $(ac)^n y^m = (bc)^n x^m$, i.e., $c^n (a^n y^m) = c^n (b^n x^m)$ for some positive integers m and n . By the condition (K) of P , $a^n y^m$ and $b^n x^m$ are comparable in P . And hence we have $a^n y^m = b^n x^m$

by the condition (L) of P . Therefore, we have $a > b$ in Q . Thus Q satisfies the conditions (H) and (E), that is, the condition (K).
