Abstract: Fluorination reaction of epoxides and alkyl mesylates can be effectively achieved by reaction with Et₃N·3HF under microwave irradiation. The reaction time could be greatly reduced compared to the reaction under thermal conditions. The reactions were completed in a few minutes and the use of large excess reagents could be avoided.

Key words: microwave irradiation, epoxides, fluorination, ring opening, Et₃N·3HF

Among HF reagents, Et₃N·3HF has been widely used as a fluorinating reagent because it is commercially available, is close to neutral, has a high boiling point, and can be used in glassware.¹ However, the fluorination reactions using Et₃N·3HF often require high temperature and long reaction time due to its low reactivity. For instance, the reaction of Et₃N·3HF with cyclohexene oxide (1a) was carried out at 115 °C for 3.5 hours to give trans-2-fluorocyclohexanol (2a) in 69% yield.² In the reaction with cyclooctene oxide (1b), it took 4 hours at 155 °C to obtain 2-fluorocyclooctanol (2b) in 54% yield. Recently, microwave irradiation has been used in many reactions to reduce the reaction time and to avoid the use of a large excess of reagents.³ However, the fluorination reaction using HF reagents under microwave irradiation had not so far been well developed.⁴

We wish to report here that the fluorination reaction using Et₃N·3HF is accelerated dramatically by microwave irradiation to provide fluorinated products in a short time. Under the microwave-irradiation conditions, the fluorination reaction of 1a and 1b was completed in 2 and 10 minutes, respectively, and only 0.6 equivalents of Et₃N·3HF to 1 equivalent of 1 was required to obtain the corresponding fluoroalcohols 2a and 2b in 61 and 60% yields respectively (Equation 1). Various epoxides 1a-e could be converted to the corresponding fluoroalcohols 2a-f in 2-10 minutes under the irradiation of microwave as shown in Table 1.
Nucleophilic substitution reaction of a fluoride with organic halides and mesylates is also a versatile method to obtain organofluorine compounds. However, the reaction of alkyl mesylate \(3a\) with \(\text{Et}_3\text{N} \cdot 3\text{HF}\) is reported to be sluggish under thermal conditions and the corresponding fluoride \(4a\) was formed in only 20\% yield after 20 hours at 80 °C.\(^5\) On the other hand, under microwave irradiation, the fluorination was completed in 2 minutes and \(4a\) was obtained in 63\% yield (Equation 2). Moreover, under the microwave irradiation conditions, only 1.2 equivalents of \(\text{Et}_3\text{N} \cdot 3\text{HF}\) to 1 equivalent of substrate was necessary, while 10 equivalents of the reagent were used under the thermal conditions.

As \(\text{Et}_3\text{N} \cdot 3\text{HF}\) is close to neutral, the reaction can tolerate functional groups such as a double bond (\(1d\)) and an ester (\(3b\)) as shown in Table 1.
diameter of 10 mm and a length of 8 cm sealed at one end. Et$_3$N·3HF was purchased from Aldrich Chemical Co. Epoxides 1a-d were purchased from Tokyo Kasei Co. (1c was a mixture of cis- and trans-isomer) and used without further purification. The epoxide 1e was prepared from dec-1-ene by the oxidation and the mesylates 3a, b were prepared from the corresponding alcohols.

$^a$ If otherwise not mentioned, 0.6 equiv of Et$_3$N·3HF to substrate was used.
$^b$ Isolated yields based on substrate used.
$^c$ A mixture of two stereoisomers was used.
$^d$ A mixture of two regioisomers was obtained.
$^e$ A mixture of two stereoisomers was obtained.
$^f$ 1.0 equiv of Et$_3$N·3HF was used.
$^g$ 1.2 equiv of Et$_3$N·3HF was used.

Fluorination Reactions with Et$_3$N·3HF; trans-2-fluorocyclohexanol (2a); Typical Procedure
Cyclohexene oxide (98 mg, 1 mmol) and Et₃N·3HF (97 mg, 0.6 mmol) were introduced into a reactor consisting of a Teflon™ PFA tube with a diameter of 10 mm sealed at one end. The open end of the reactor was connected to the port in the oven and the port was connected to a reflux condenser located outside the oven. Then, the reaction mixture was submitted to microwave irradiation for 2 min. After cooling, the reaction mixture was poured into aq NaHCO₃ soln. The product was extracted with Et₂O (3 X) and the combined ethereal layers were dried (MgSO₄). Purification by column chromatography (silica gel/hexane- Et₂O) gave 2a in 61% yield; mp 22-23 °C (lit.² 22-24 °C).
