REMARKS ON MODIFIED IMPROVED BOUSSINESQ EQUATIONS IN ONE SPACE DIMENSION

YONGGEUN CHO AND TOHRU OZAWA

Abstract. We study the existence and scattering of global small amplitude solutions to modified improved Boussinesq equations in one dimension with nonlinear term \( f(u) \) behaving as a power \( u^p \) as \( u \to 0 \). Solutions in \( H^s \) space are considered for all \( s > 0 \). According to the value of \( s \), the power nonlinearity exponent \( p \) is determined. Liu [15] obtained the minimum value of \( p \) greater than 8 at \( s = \frac{3}{2} \) for sufficiently small Cauchy data. In this paper, we prove that \( p \) can be reduced to be greater than \( \frac{9}{2} \) at \( s > \frac{8}{5} \) and the corresponding solution \( u \) has the time decay such as \( \|u(t)\|_{L^\infty} = O(t^{-\frac{2}{5}}) \) as \( t \to \infty \). We also prove nonexistence of nontrivial asymptotically free solutions for \( 1 < p \leq 2 \) under vanishing condition near zero frequency on asymptotic states.

1. Introduction

We consider the following initial value problem for the one dimensional generalized IMBq equation (Modified Improved Boussinesq equation):

\[
\begin{align*}
&u_{tt} - u_{xxtt} - u_{xx} = (f(u))_{xx}, \quad (x, t) \in \mathbb{R} \times (0, +\infty), \\
&u(x, 0) = \varphi(x), \quad u_t(x, 0) = \psi(x), \quad x \in \mathbb{R},
\end{align*}
\]

where \( f \in C^k(\mathbb{C}) \) in the real sense and \( |f^{(l)}(u)| \leq |u|^{p-l} \) for \( 0 \leq l \leq k \leq p \) and \( p > 1 \). By Duhamel’s principle, the solution \( u \) can be written as

\[
\begin{align*}
&u(x, t) = (\partial_t S(t) \varphi)(x) + (S(t) \psi)(x) + \int_0^t T(t - t') f(u(t')) dt'.
\end{align*}
\]

Here \( T(t) = S(t)(I - \partial_x^2)^{-1} \partial_x^2 \) and

\[
\begin{align*}
&(\partial_t S(t) \varphi)(x) = \frac{1}{2\pi} \int_{\mathbb{R}} e^{ix\xi} \cos \left( \frac{t\xi}{\sqrt{1 + \xi^2}} \right) \hat{\varphi}(\xi) d\xi, \\
&(S(t) \psi)(x) = \frac{1}{2\pi} \int_{\mathbb{R}} e^{ix\xi} \sin \left( \frac{t\xi}{\sqrt{1 + \xi^2}} \right) \frac{\sqrt{1 + \xi^2}}{\xi} \hat{\psi}(\xi) d\xi,
\end{align*}
\]

where \( \hat{\varphi}(\xi) = \mathcal{F}(\varphi)(\xi) = \int_{\mathbb{R}} e^{-ix \xi} \varphi(x) dx \) is the Fourier transform of \( \varphi \).

The generalized IMBq equation governs the various physical models like non-linear wave in weakly dispersive medium (in this case \( f(u) = u^2 \) [3, 13, 16]) and longitudinal variation wave in elastic rod \((f(u) = u^3 \) or \( u^5 \) [10]), etc. For the local

Key words and phrases. IMBq equation, small amplitude solution, global existence, scattering.

The first author is JSPS Fellow.
Let \( \phi \) be a function. According to the regularity of initial data, and also the upper bound of nonlinearity, we consider the global existence of solution of IMBq equations, see [4, 5, 6, 8, 15], and for the small amplitude solution and scattering, see [7, 15].

In this paper, the small amplitude solution and scattering to the nonlinear problem \((1.1)\) are considered in one dimensional case. Our main concern is to provide the lower bound of nonlinearity \( p \) for the global existence of solution and scattering according to the regularity of initial data, and also the upper bound of \( p \) for the nonexistence of nontrivial asymptotically free solutions. The methods below can be applied to the high dimensional case as well without any difficulty. For this see the section 3.3 Remarks below.

To state our main results, let us define a function space \( X^s_{\delta, \theta} \) by
\[
X^s_{\delta, \theta} = \{ v : \|v\|_{s, \theta} \equiv \sup_{t > 0} (1 + t)^{\theta} \|v\|_{L^\infty} + \sup_{t > 0} \|D^s v\|_{L^2} \leq \rho \},
\]
and \( D^a L^1 \) and \( DL^2 \) by \( \{ \phi : D^{-a} \phi \in L^1 \} \) and \( \{ \phi : D^{-1} \phi \in L^2 \} \) respectively, where \( D = \sqrt{-\partial^2} \). We use the usual Sobolev spaces \( W^s_p \) and \( H^s \) with the norms
\[
\|\phi\|_{W^s_p} = \|\phi\|_{L^p} + \|D^s \phi\|_{L^p}, \quad \|\phi\|_{H^s} = \|\phi\|_{W^s_2}.
\]

The first result is on the following global existence for small data.

**Theorem 1.1.** Let \( s, p, \alpha \) be numbers such that \( k \geq s > 2 - \frac{4}{r} \)
\[
p > \max \left( \frac{4r - 4}{r - 2}, \frac{r + 8}{r} \right) \quad \text{and} \quad \alpha = \max \left( \frac{3(r - 2)}{4r}, \frac{r - 2}{4} \right)
\]
for \( 2 < r < \infty \). Suppose that the data \((\phi, \psi)\) satisfy the regularity condition
\[
(\phi, \psi) \in (L^1 \cap D^{max(0, \alpha - 1)} L^1 \cap W^s_\rho \cap H^s) \times (L^1 \cap D^a L^1 \cap DL^2 \cap W^s_\rho \cap H^s)
\]
and the smallness condition
\[
\|\phi\|_{L^1} + \|D^{-max(0, \alpha - 1)} \phi\|_{L^1} + \|\phi\|_{W^s_\rho} + \|\phi\|_{H^s} + \|\psi\|_{L^1} + \|D^{-\alpha} \psi\|_{L^1} + \|D^{-1} \psi\|_{L^2} + \|\psi\|_{W^s_\rho} + \|\psi\|_{H^s} \leq \delta.
\]
Then if \( \delta \) is sufficiently small, there exists a unique global solution \( u \in C^1([0, \infty); L^\infty \cap H^s) \) of \((1.2)\) and small positive number \( \rho \) depending only on \( r, \delta \) such that
\[
\|u\|_{s, \min \left( \frac{r - 2}{4r}, \frac{r}{4} \right)} + \|u_t\|_{s, \min \left( \frac{r - 2}{4r}, \frac{r}{4} \right)} \leq \rho.
\]
The next is on the scattering.

**Theorem 1.2.** Let \( u \) be the solution of \((1.2)\) as in Theorem 1.1. Then there exist functions \( \phi^+ \) and \( \psi^+ \) in \( H^s \) such that
\[
\|u(t) - u^+(t)\|_{H^s} + \|u_t(t) - u^+_t(t)\|_{H^s} = O(t^{-(p - 1)min \left( \frac{r - 2}{4r}, \frac{r}{4} \right)+1}),
\]
where \( u^+ \) is the unique solution of linear homogeneous equation
\[
\begin{align*}
\phi_{tt} - \phi_{ttxx} - \phi_{xx} &= 0, \\
u^+(0) &= \varphi^+, u^+_t(0) &= \psi^+.
\end{align*}
\]
The minimum values of $p$ can be chosen to be greater than $\frac{9}{2}$ at $r = 10$ and then $\alpha = 2$ and $s > \frac{8}{5}$. We also have that $\sup_{t>0}(1 + t)^{\frac{3}{2}}\|u(t)\|_{L^\infty} < \infty$. If we choose $r = 6$, then we can take the values $p, \alpha, s$ as $p > 5$, $\alpha = 1$ and $s > \frac{4}{3}$, and also have that $\sup_{t>0}(1 + t)^{\frac{3}{2}}\|u(t)\|_{L^\infty} < \infty$. Thus Theorems 1.1 and 1.2 contain the physical situation $p = 5$ and also give slight improvements of the previous result [15] in which the global existence was established for $p > 8$ at $s = \frac{3}{2}$ and the value of $s$ should be greater than $\frac{1}{2}$ for the scattering. Moreover, even if $s \leq \frac{1}{2}$ (this can occur for $2 < r < \frac{8}{3}$), the global existence can be established and time decay estimate can be obtained without resort to the Sobolev embedding $H^s \hookrightarrow L^\infty$ for $s > \frac{1}{2}$.

For the purpose of improvement, we use the stationary phase method and Young’s inequality ($\|u \ast v\|_{L^\infty} \leq \|u\|_{L^p} \|v\|_{L^{p'}}$) for the dyadically localized kernel estimate of high frequency part of $\partial_tS, S$ and $T$ instead of integration estimate used in [15] and [7]. For the kernel estimate, the condition $\varphi, \psi \in W^s_1$ is used. We also use van der Corput type estimate for medium frequency part of the operators similar to the one in [7, 15]. To obtain an estimate for low frequency part, the condition $\psi \in D^s L^1 \cap DL^2$ is necessary. For the details, see Section 2.2 below.

In [7], the same problem was considered and some extended results were obtained but the results should be corrected because the authors overlooked the bad behavior of low frequency part of $S(t)\psi$ at near zero frequency which causes troubles in $L^\infty$ and $H^s$ estimates.

In view of Theorem 1.1, if $r = 10$ and hence $\varphi \in D(L^1 \cap L^2)$ and $\psi \in D^2(\mathbb{R}^1 \cap L^2)$, then for $p > \frac{9}{2}$, it can be easily shown that $(u, u_t) \in L^\infty(0, \infty; DL^2 \times D^2L^2)$ by the decay estimate $\sup_{t>0}(1 + t)^{\frac{3}{2}}\|u(t)\|_{L^\infty} < \infty$ and the scattering $\|u(t) - u^+(t)\|_{L^2} = O(t^{-\frac{3}{2}})$. On the other hand, the following theorem shows that there is no nontrivial asymptotically free solution $u$ with $\|u(t) - u^+(t)\|_{L^2} = O(t^{-\varepsilon})$, if $p$ is small and $(u, u_t) \in L^\infty(0, \infty; DL^2 \times D^2L^2)$.

**Theorem 1.3.** Let $1 < p \leq 2$ and suppose that $\text{Re}(f(u)\overline{\varphi}) \geq c|u|^{p+1}$ for some positive constant $c$. Let $u$ be a smooth solution $u$ to (1.1) with $(u, u_t) \in L^\infty(0, \infty; DL^2 \times D^2L^2)$ and $(\varphi^+, \psi^+)$ be a pair of smooth functions with compactly supported $\varphi^+$ and $\psi^+$ in $\mathbb{R} \setminus \{0\}$. Suppose that

\begin{equation}
\|u(t) - u^+(t)\|_{L^2} = O(t^{-\varepsilon}) \quad \text{as} \quad t \to \infty
\end{equation}

for some $\varepsilon > 0$, where $u^+$ is the free solution to the linear problem (1.4). Then $u = u^+ = 0$.

The theorem above shows that IBq equation (corresponding to the physical situation $f(u) = u^2$) does not have nontrivial asymptotically free solution. But it remains open whether the theorem is true for $p > 2$ in one dimensional case or not. For the proof, we use an analogous argument to the one of Glassey [11] that
Taking a direct application of van der Corput lemma [18] yields readily the proof. First, we introduce an estimate of oscillatory integral. For $W$

Proof. Let us choose a Littlewood-Paley function $\eta$ with and define a frequency projection operator $P_N$ for a dyadic number $N$ by

$$P_N \phi(x) = \frac{1}{2\pi} \int e^{ix\xi} \eta \left( \frac{\xi}{N} \right) \hat{\phi}(\xi) \, d\xi,$$

And we also denote $P_{\leq N} \phi$, $P_{\geq N_0} \phi$ and $P_{\varepsilon < N_0} \phi$ by

$$P_{\leq N} \phi = \sum_{N \leq \varepsilon} P_N \phi \quad \text{(low frequency part)},$$

$$P_{\geq N_0} \phi = \sum_{N \geq N_0} P_N \phi \quad \text{(high frequency part)},$$

$$P_{\varepsilon < N_0} \phi = \sum_{\varepsilon < N < N_0} P_N \phi \quad \text{(medium frequency part)}.$$

We choose $\sigma$ so that $P_N = P_{N-2 < N} P_N$. We also denote $\partial_t S(t) \varphi$ with $\alpha = \frac{r-2}{r}$ we have

$$\| \partial_t S(t) \varphi \|_{L^\infty} \lesssim (1 + t)^{-\frac{r}{2} - \frac{1}{2}} (\| \varphi \|_{L^1} + \| D^{-\min(0,\alpha-1)} \varphi \|_{L^1} + \| D^\alpha \varphi \|_{L^{r'}}).$$

Proof. Taking $P_N$ to $\partial_t S(t)$ and using change of variable, we have

$$|P_N(\partial_t S(t) \varphi)(x)| = \left| \int e^{iN\xi} \cos(N^{-2}t\omega_N(\xi)) \eta(\xi) F \left[ P_{N-2 < N+2} \varphi \left( \frac{\xi}{N} \right) \right] \xi \, d\xi \right| \lesssim |K(N(\cdot), N^{-2}t) \ast P_{N-2 < N+2} \varphi \left( \frac{\xi}{N} \right) ,$$

where $m \geq 0$ and $F \in C^1[\varepsilon, R]$. Proof. A direct application of van der Corput lemma [18] yields readily the proof. For the case $m = 0$, see Lemma 4.3 in [15] or Lemma 2.2 in [7].
where $\omega_N(\xi) = \frac{N^2 \xi}{\sqrt{N^2 + \xi^2}}$ and

$$K(Nx, N^{-2} t) = \frac{1}{2\pi} \int e^{i Nx \xi} \cos(N^{-2} t \omega_N) \eta(\xi) \, d\xi$$

$$= \frac{1}{4\pi} \int \left( e^{i (Nx \xi + N^{-2} t \omega_N)} + e^{i (Nx \xi - N^{-2} t \omega_N)} \right) \eta(\xi) \, d\xi.$$  

Since $|\omega_N'(\xi)| \sim |\omega_N''(\xi)| \sim 1$ for sufficiently large $N$ and $|\xi| \sim 1$, by the method of stationary and non-stationary phase [18], we have

$$|P_N(\partial_t S(t) \varphi)(x)| \lesssim \int (1 + N^{-2} t + N|x - y|)^{-\frac{3}{2}} |P_{N-2 < \cdot < N+2} \varphi\left(\frac{y}{N}\right)| \, dy$$

$$\lesssim \parallel(1 + N^{-2} t + N|\cdot|)^{-\frac{3}{2}}\parallel_{L'} |P_{N-2 < \cdot < N+2} \varphi\left(\frac{y}{N}\right)|_{L''}$$

$$\lesssim (1 + N^{-2} t)^{-\frac{3}{2}} \left(\frac{N}{1 + N^{-2} t}\right)^{-\frac{1}{2}} N^2 \parallel P_{N-2 < \cdot < N+2} \varphi\parallel_{L''}$$

$$\lesssim (1 + t)^{-\left(\frac{2}{r} - \frac{1}{2}\right)} N^2 \parallel P_{N-2 < \cdot < N+2} \varphi\parallel_{L''}.$$  

Thus using $s > 2 - \frac{4}{r}$, we deduce that for large $N_0$ and any $2 < r < \infty$

$$\|P_{\geq N_0} \partial_t S(t) \varphi\|_{L^\infty} \lesssim \sum_{N \geq N_0} (1 + t)^{-\frac{1}{2}} N^2 \parallel P_{N-2 < \cdot < N+2} \varphi\parallel_{L''}$$

(2.1)

$$\lesssim (1 + t)^{-\frac{1}{2}} \|P_{\geq 1} \varphi\|_{B^s_{r,2} \cap \dot{B}^s_{r,s}}$$

$$\lesssim (1 + t)^{-\frac{1}{2}} \|\partial_t \varphi\|_{L^\infty}.$$  

Here $B^s_{r,2}$ is the Besov space with norm for $s > 0, 1 < r' < \infty$ by

$$\|\varphi\|_{B^s_{r,2}} = \|\varphi\|_{L^r} + \left( \sum_{N: \text{dyadic number}} N^2 \|P_N \varphi\|_{L^{r'}}^2 \right)^{\frac{1}{2}}.$$  

For the last inequality, we used the well-known embedding $W^s_q \hookrightarrow B^s_{q,2}$ for $1 < q \leq 2$ and the fact $\|P_{\geq 1} \varphi\|_{W^s_q} \lesssim \|D^s \varphi\|_{L^{r'}}$ (see for instance [2]).

As for the medium frequency of $\partial_t S(t) \varphi$, using Lemma 2.1, we can easily show that for $t > 1$

$$\|P_{\ll t^{-\frac{1}{r}} N_0} \partial_t S(t) \varphi\|_{L^\infty} \lesssim \max(\epsilon^{-\frac{1}{2}}, N_0^2) t^{-\frac{1}{2}} \|\varphi\|_{L^1}.$$  

By Hausdorff-Young’s inequality, we have

$$\|P_{\ll \epsilon \partial_t S(t) \varphi\|_{L^\infty} \lesssim \|\varphi\|_{L^1}, \text{ if } r \leq 6,$$

$$\|P_{\ll \epsilon \partial_t S(t) \varphi\|_{L^\infty} \lesssim \epsilon\|D^{-(\alpha-1)} \varphi\|_{L^1}, \text{ if } r > 6.$$  

Now let us choose $\epsilon$ by $t^{-\frac{1}{2}} (\ll N_0^{-4})$. Then since $\frac{2}{r} \geq 2 - 1 - \frac{1}{r}$ for $r \leq 6$ and $\frac{2}{r} \geq \frac{1}{2} - \frac{1}{4}$ for $r > 6$, from (2.2) and (2.3) we have for $t > N_0^2$

$$\|P_{\ll N_0} \partial_t S(t) \varphi\|_{L^\infty} \lesssim t^{-\left(\frac{2}{r} - \frac{1}{4}\right)} \|\varphi\|_{L^1} \text{ for } r \leq 6,$$

$$\|P_{\ll N_0} \partial_t S(t) \varphi\|_{L^\infty} \lesssim t^{-\left(\frac{2}{r} - \frac{1}{2}\right)} (\|\varphi\|_{L^1} + \|D^{-(\alpha-1)} \varphi\|_{L^1}) \text{ for } r > 6.$$
Let \( t \leq N_0^2r \), then by another use of the method of non-stationary phase, we have
\[
\|\partial_t S(t)\|_{L^\infty} \leq \|P_{\leq N_0^1} \partial_t S(t)\|_{L^\infty} + \|P_{> N_0^2} \partial_t S(t)\|_{L^\infty} \\
\lesssim \|\varphi\|_{L^1} + \sum_{N>N_0^1} N^{1-\frac{2}{s}} \|P_N \varphi\|_{L^{r'}} \lesssim \|\varphi\|_{L^1} + \|D^s \varphi\|_{L^{r'}}.
\]
Combining this estimate, (2.1) and (2.4), we obtain for \( \alpha = \frac{r-2}{4} \)
\[
\|\partial_t S(t)\|_{L^\infty} \lesssim (1 + t)^{-\frac{1}{4}-\frac{1}{4}}(\|\varphi\|_{L^1} + \|D^{-\alpha}\varphi\|_{L^1} + \|D^s \varphi\|_{L^{r'}}).
\]

\( \square \)

**Lemma 2.3.** Let \( 2 < r < \infty \) and \( s > 2 - \frac{1}{r} \). Then for any \( \psi \in L^1 \cap D^\alpha L^1 \cap W^s_p \) with \( \alpha = \frac{3(r-2)}{2r} \), if \( r \leq 6 \) and \( \alpha = \frac{r-2}{4} \), if \( r > 6 \) we have
\[
\|S(t)\psi\|_{L^\infty} \lesssim (1 + t)^{-\frac{1}{4}-\frac{1}{4}}(\|\psi\|_{L^1} + \|D^{-\alpha}\psi\|_{L^1} + \|D^s \psi\|_{L^{r'}}).
\]

**Proof.** The proof for the high frequency part of \( S(t) \) is almost the same as the one for \( \partial_t S(t) \). Thus we consider only the low and medium frequency parts. With \( \alpha \) as above, we have
\[
\|P_{\leq \varepsilon} S(t)\|_{L^\infty} \lesssim \varepsilon^\alpha \|D^{-\alpha}\psi\|_{L^1}.
\]
On the other hand, for the medium frequency we have from Lemma 2.1 that
\[
\|P_{t< N_0^1} S(t)\|_{L^\infty} \lesssim \max(1, \varepsilon^{-(1-\alpha)}) \max(\varepsilon^{-\frac{1}{2}}, N_0^2 t^{-\frac{1}{r}} \|D^{-\alpha}\psi\|_{L^1},
\]
if \( t > 1 \). Now if we choose \( \varepsilon = t^{-\frac{2}{r} + \frac{1}{2} - \frac{1}{r}} (\leq N_0^{-4} ) \) for \( r \leq 6 \) and \( t^{-\frac{2}{r} + \frac{1}{2} - \frac{1}{r}} (\leq N_0^{-4} ) \) for \( r > 6 \), then since \( \frac{2r}{r-2} \geq \frac{1}{2} - \frac{1}{r} \) for \( r \leq 6 \) and \( \frac{2r}{r-2} \geq \frac{1}{2} - \frac{1}{r} \), we have
\[
\|S(t)\|_{L^\infty} \lesssim t^{-\frac{1}{4}-\frac{1}{4}}(\|\psi\|_{L^1} + \|D^{-\alpha}\psi\|_{L^1} + \|D^s \psi\|_{L^{r'}})
\]
for large \( t \). If \( t \) is small, then similarly to the estimate for \( \partial_t S(t) \) we have
\[
\|S(t)\|_{L^\infty} \leq \|P_{\leq N_0^1} S(t)\|_{L^\infty} + \|P_{> N_0^1} S(t)\|_{L^\infty} \\
\lesssim \|D^{-\alpha}\psi\|_{L^1} + \|D^s \psi\|_{L^{r'}}.
\]
where \( \beta = (3-2\alpha)r \) for \( r \leq 6 \) and \( \beta = r \) for \( r > 6 \). We have just finished the proof of the lemma. \( \square \)

As a corollary of Lemmas 2.2 and 2.3, we have the following lemma.

**Lemma 2.4.** Let \( 2 < r < \infty \) and \( s > 2 - \frac{r}{2} \). Then for any \( g(\cdot, t) \in L^1 \cap W^s_p \), we have
\[
\left\| \int_0^t (T(t-t')g(t') dt' \right\|_{L^\infty} \lesssim \int_0^t (1 + t-t')^{-\min(\frac{1}{2} - \frac{1}{r}, \frac{r}{2})}(\|g(t')\|_{L^1} + \|D^s g(t')\|_{L^{r'}}) dt'.
\]

**Proof.** The only difference between \( T(t) \) and \( \partial_t S(t) \) consists in the lower frequency part. For this, we have
\[
\|P_{\leq \varepsilon} T(t)g\|_{L^\infty} \lesssim \varepsilon^{\frac{3}{2}} \|g\|_{L^1}.
\]
Thus from the low and medium frequency estimate in the proof of Lemma 2.2, we deduce
\[ \|P_{\leq N_0}T(t)g\|_{L^\infty} \lesssim t^{-\min\left(\frac{1}{2}, \frac{1}{r}\right)} \|g\|_{L^1} \]
for large \( t \). This completes the proof. \( \square \)

### 2.2. Remarks on the linear estimates.

In view of the proof of Lemmas 2.2 and 2.3, it follows that if \( D^{-(\alpha-1)}\varphi, D^{-\alpha}\psi \in L^1 \) for \( \alpha > 1 \), the range of \( r \) can be extended up to \( 4\alpha + 2 \) and hence the time decay of supremum norm becomes faster. This fact implies that if \( \hat{\varphi} \) and \( \hat{\psi} \) are zero near the origin and compactly supported, then the time decay rate can be taken by the maximal decay rate \( \frac{1}{2} \). Thus we can expect that the scattering holds up to \( p > 3 \) as the case of Schrödinger equation. But in Lemma 2.4, we were not able to obtain such decay because of the infinite speed of propagation which makes it impossible to use the zero frequency. We need more subtle estimate near zero frequency.

In Lemmas 2.2 and 2.3, we used the condition \( D^{-\alpha}\psi \in L^1 \) and \( D^{-1}\psi \in L^2 \) for some time decay of the supreme norm and uniform bound on time of Sobolev norm of \( S\psi \), respectively. In [15], the condition \( (1-\partial_x^2)^{\frac{1}{2}}D^{-1}\psi \in L^1 \cap L^2 \) was used. Actually, the condition \( (1-\partial_x^2)^{\frac{1}{2}}D^{-1}\psi \in L^2 \) is necessary for the energy conservation and momentum conservation. This type condition implies at least that \( \hat{\psi} \) should be zero at \( \xi = 0 \). This vanishing condition at zero frequency turns out to be inevitable for the uniform bound because of the following fact: if \( \hat{\psi} = 1 \) if \( |\xi| < 1 \) and \( \hat{\psi} = 0 \) if \( |\xi| > 2 \), then for large \( t \)
\[ \|S(t)\psi\|_{L^2} \sim t \int \frac{1+\xi^2/t^2}{\xi^2} \sin\left(\frac{\xi}{\sqrt{1+\xi^2/t^2}}\right) \left|\hat{\psi}(\xi/t)\right|^2 d\xi \gtrsim t \int |\hat{\psi}|^2 d\xi \to \infty. \]

Moreover, the vanishing condition is inevitable for the time decay. To see this, let \( \psi \) be a smooth function such that \( \hat{\psi} = 1 \) if \( |\xi| < 1 \) and \( \hat{\psi} = 0 \) if \( |\xi| > 2 \). Then the limit \( \lim_{t \to \infty} S(t)\psi(x) \) exists for all \( x \) and the following holds
\[ \lim_{t \to \infty} \|S(t)\psi\|_{L^\infty} \geq \frac{1}{2}. \]

For the proof let us choose a positive number \( \theta \) smaller than \( \frac{1}{4} \). Then by Lemma 2.1 with \( m = 1 \) and \( F(\xi) = \sqrt{1+\xi^2}(1-\hat{\psi}(t^\theta\xi))\hat{\psi}(\xi) \), we have
\[ \left\| \int_{\mathbb{R}} e^{ix\xi} \sin\left(\frac{t\xi}{\sqrt{1+\xi^2}}\right) \frac{\sqrt{1+\xi^2}}{\xi} (1-\hat{\psi}(t^\theta\xi))\hat{\psi}(\xi) d\xi \right\|_{L^\infty} \lesssim t^{\frac{2\theta-2}{2}} \to 0 \]
as \( t \to \infty \). Thus for the proof of the estimate (2.5), it suffices to show that
\[ \frac{1}{2\pi} \int_{\mathbb{R}} e^{ix\xi} \sin\left(\frac{t\xi}{\sqrt{1+\xi^2}}\right) \frac{\sqrt{1+\xi^2}}{\xi} \hat{\psi}(t^\theta\xi) d\xi \to \frac{1}{2\pi}. \]
uniformly on compact subsets of \( \mathbb{R} \). Letting \( \varepsilon = t^{-1} \), by change of variable, we have

\[
\frac{1}{2\pi} \int_{\mathbb{R}} e^{i\varepsilon x \xi} \sin \left( \frac{t\xi}{\sqrt{1 + \varepsilon^2 \xi^2}} \right) \frac{\sqrt{1 + \xi^2}}{\xi} \tilde{\psi}(t^\theta \xi) \, d\xi = \frac{1}{2\pi} \int_{\mathbb{R}} e^{i\varepsilon x \xi} \sin \left( \frac{\xi}{\sqrt{1 + \varepsilon^2 \xi^2}} \right) \frac{\sqrt{1 + \varepsilon^2 \xi^2}}{\xi} \tilde{\psi}(\varepsilon^{1-\theta} \xi) \, d\xi.
\]

By an integration by parts, we have

\[
\int_{\mathbb{R}} e^{i\varepsilon x \xi} \left( \sin \xi - \sin \left( \frac{\xi}{\sqrt{1 + \varepsilon^2 \xi^2}} \right) \right) \frac{\sqrt{1 + \varepsilon^2 \xi^2}}{\xi} \tilde{\psi}(\varepsilon^{1-\theta} \xi) \, d\xi = -\int_{0}^{1} \int_{\mathbb{R}} \cos \left( \lambda \xi + (1 - \lambda) \frac{\xi}{\sqrt{1 + \varepsilon^2 \xi^2}} \right) \times \left( \frac{\xi - \frac{\xi}{\sqrt{1 + \varepsilon^2 \xi^2}}}{\lambda + \frac{(1-\lambda)}{(1+\varepsilon^2 \xi^2)^{3/2}}} \right) e^{i\varepsilon x \xi} \tilde{\psi}(\varepsilon^{1-\theta} \xi) \, d\xi d\lambda = o(1) \quad \text{as} \quad \varepsilon \to 0 \quad \text{uniformly on compact subsets of} \quad \mathbb{R}.
\]

We also have

\[
\int_{\mathbb{R}} e^{i\varepsilon x \xi} \left( \frac{\sin \xi}{\xi} (\sqrt{1 + \varepsilon^2 \xi^2} - 1) \tilde{\psi}(\varepsilon^{1-\theta} \xi) \right) d\xi = o(1) \quad \text{as} \quad \varepsilon \to 0
\]

uniformly on compact subsets of \( \mathbb{R} \). From these two estimates, we deduce that it suffices to show

\[
\lim_{\varepsilon \to 0} \frac{1}{2\pi} \int_{\mathbb{R}} e^{i\varepsilon x \xi} \frac{\sin \xi}{\xi} \tilde{\psi}(\varepsilon^{1-\theta} \xi) \, d\xi = \pi.
\]

Since \( \frac{\sin \xi}{\xi} = \frac{1}{2i} \int_{-1}^{1} e^{i\xi y} \, dy \) and \( \int \tilde{\psi} \, dx = 1 \), we have

\[
\frac{1}{2\pi} \int_{\mathbb{R}} e^{i\varepsilon x \xi} \frac{\sin \xi}{\xi} \tilde{\psi}(\varepsilon^{1-\theta} \xi) \, d\xi = \frac{1}{4\pi i} \int_{-1}^{1} e^{i\xi(x+y)} \tilde{\psi}(\varepsilon^{1-\theta} \xi) \, d\xi \, dy
\]

\[
= e^{-(1-\theta)} \frac{1}{2i} \int_{-1}^{1} \psi \left( \frac{\varepsilon x + y}{\varepsilon^{1-\theta}} \right) \, dy
\]

\[
= \frac{1}{2i} \int_{\frac{-1}{\varepsilon^{1-\theta}}}^{\frac{1}{\varepsilon^{1-\theta}}} \psi \left( \frac{y}{\varepsilon^{1-\theta}} \right) \, dy \quad \text{as} \quad \varepsilon \to 0
\]

uniformly on compact subsets of \( \mathbb{R} \). This completes the proof of (2.5).
3. Proof of the Theorems

3.1. Existence and scattering. The strategy of proof is to use the standard contraction mapping theorem. For this purpose, let us define a nonlinear mapping $\mathcal{N}$ by

$$\mathcal{N}(u) = \partial_t S(t)\varphi + S(t)\psi + \int_0^t T(t - t') f(u)(t') \, dt'.$$

We will prove that for sufficiently small $\rho$, $\mathcal{N}$ maps from $X^s_\rho$ to $X^s_\rho$. To do this, we introduce generalized chain and Leibniz rules:

**Lemma 3.1.** For any $s \geq 0$, we have

\begin{align*}
\|D^s f(u)\|_{L^r} &\lesssim \|u\|_{L^{r_1}(\rho^2)}^{-1} \|D^s\|_{L^{r_2}}, \\
\left(\frac{1}{r} = \frac{1}{r_1} + \frac{1}{r_2}, \quad r_i \in (1, \infty], r_2 \in (1, \infty)\right) \\
\|D^s(uv)\|_{L^r} &\lesssim \|D^s u\|_{L^{r_1}} \|v\|_{L^{r_2}} + \|u\|_{L^{r_1}} \|D^s v\|_{L^{r_2}}, \\
\left(\frac{1}{r} = \frac{1}{r_1} + \frac{1}{q_2} = \frac{1}{q_1} + \frac{1}{r_2}, \quad r_i \in (1, \infty), q_i \in (1, \infty) \quad (i = 1, 2)\right)
\end{align*}

We should emphasize that the exponents $r_1$ of (3.1), $q_1, q_2$ of (3.2) can be infinite. One can easily prove the lemma above by following and modifying slightly the proof of Proposition 3.1 and 3.3 in [9]. Also see the appendix of [14].

Now let $s > 2 - \frac{4}{\theta}$ and $\theta = \min\left(\frac{1}{2} - \frac{1}{r_1}, \frac{2}{r_2}\right)$. Then from Lemma 2.2–2.4, the condition (1.3) and the chain rule (3.1), it follows that for any $u \in X^s_\rho$,

\begin{align*}
\|\mathcal{N}(u)\|_{L^\infty} &\lesssim (1 + t)^{-\theta} \delta + \int_0^t (1 + t - t')^{-\theta} (\|f(u)\|_{L^1} + \|D^s f(u)\|_{L^r}) \, dt' \\
&\lesssim (1 + t)^{-\theta} \delta + \int_0^t (1 + t - t')^{-\theta} (\|u\|_{L^{r_1}}^{-2} \|u\|_{L^2}^2 + \|u\|_{L^{r_1}}^{-1} \|D^s u\|_{L^2}) \, dt' \\
&\lesssim (1 + t)^{-\theta} \delta + \int_0^t (1 + t - t')^{-\theta} (\|u\|_{L^{r_1}}^{-2} \|u\|_{L^2}^2 + \|u\|_{L^{r_1}}^{-2 + \frac{2}{r}} \|u\|_{L^2}^{1 - \frac{2}{r}} \|D^s u\|_{L^2}) \, dt' \\
&\lesssim (1 + t)^{-\theta} \delta + \rho^p \int_0^t (1 + t - t')^{-\theta} (1 + t')^{-(p - 2)\theta} \, dt'.
\end{align*}

Since $(p - 2)\theta > 1$, we have for sufficiently small $\delta$ and $\rho$

\begin{equation}
\sup_{t > 0} (1 + t)^{\theta} \|\mathcal{N}(u)\|_{L^\infty} \lesssim \delta + \rho^p < \frac{\rho}{2}.
\end{equation}
And also we have
\[
\|N(u)\|_{H^s} \lesssim \|\varphi\|_{H^s} + \|D^{-1} \psi\|_{L^2} + \|\psi\|_{H^s} + \int_0^t \|f(u)\|_{H^s} \, dt'
\lesssim \|\varphi\|_{H^s} + \|D^{-1} \psi\|_{L^2} + \|\psi\|_{H^s} + \int_0^t (\|u\|_{L^{2n}}^p + \|u\|_{L^\infty}^p \|D^s u\|_{L^2}) \, dt'
\lesssim \delta + \rho^p < \frac{\rho}{2}.
\]
(3.4)

Thus \(N\) maps from \(X^s_p, \rho\) to \(X^s_p, \rho\).

Now for any \(u, v \in X^s_p, \rho\) we can show from the chain rule (3.1) and Leibniz rule (3.2) that if \(\delta\) and \(\rho\) are sufficiently small, then
\[
\|N(u) - N(v)\|_{L^\infty} \lesssim \int_0^t (1 + t - t')^{-\theta} (\|f(u) - f(v)\|_{L^1} + \|D^s (f(u) - f(v))\|_{L^r}) \, dt'
\lesssim \int_0^t (1 + t - t')^{-\theta} \left( \left( \|u\|_{L^{2n}}^p \|u\|_{L^2}^2 + \|v\|_{L^{2n}}^p \|v\|_{L^2}^2 \right) \|u - v\|_{L^\infty} + \|u\|_{L^{2n}}^p \|u\|_{L^2}^2 + \|v\|_{L^{2n}}^p \|v\|_{L^2}^2 \right) \|u - v\|_{L^\infty} \right) \, dt'
\lesssim \rho^{p-1} ||u - v||_{s, \theta} \int_0^t (1 + t - t')^{-\theta} (1 + t')^{-\theta(p-2)} \, dt'
\lesssim (1 + t)^{-\theta} \rho^{p-1} ||u - v||_{s, \theta}.
\]

Similarly, we can also show
\[
\|N(u) - N(v)\|_{H^s} \lesssim \rho^{p-1} ||u - v||_{s, \theta}.
\]

Thus for small \(\rho\), \(N\) is a contraction mapping and hence there exists a unique solution \(u \in X^s_p, \rho\) to the problem \(N(u) = u\).

Since the time derivative \(u_t\) satisfies the following equation:
\[
u_t(x, t) = -\frac{1}{2\pi} \int_{\mathbb{R}} e^{ix\xi} \sin \left( \frac{t \xi}{\sqrt{1 + \xi^2}} \right) \frac{\xi}{\sqrt{1 + \xi^2}} \hat{\varphi} \, d\xi + \frac{1}{2\pi} \int_{\mathbb{R}} e^{ix\xi} \cos \left( \frac{t \xi}{\sqrt{1 + \xi^2}} \right) \hat{\psi} \, d\xi
\]
\[
+ \frac{1}{2\pi} \int_0^t \int_{\mathbb{R}} e^{ix\xi} \cos \left( \frac{(t - t') \xi}{\sqrt{1 + \xi^2}} \right) \frac{\xi^2}{1 + \xi^2} f(u)(\xi, t') \, d\xi dt',
\]
by the same argument in Section 2, one can easily show that \(u_t \in X^s_p, \rho\), provided \(\delta\) and \(\rho\) are much smaller. This completes the proof of Theorem 1.1.
Once the existence has been established, the proof of Theorem 1.2 is rather straightforward. Let us define functions $\varphi^+$ and $\psi^+$ by
\[
\hat{\varphi}^+(\xi) = \hat{\varphi}(\xi) + \int_0^\infty \frac{\xi}{\sqrt{1 + \xi^2}} \sin \frac{t\xi}{\sqrt{1 + \xi^2}} f(u)(\xi, t) \, dt,
\]
\[
\hat{\psi}^+(\xi) = \hat{\psi}(\xi) - \int_0^\infty \frac{\xi^2}{1 + \xi^2} \cos \frac{t\xi}{\sqrt{1 + \xi^2}} f(u)(\xi, t) \, dt.
\]
Let $u^+$ be the solution to the linear problem (1.4) with initial data $(\varphi^+, \psi^+)$. Then it can be represented by
\[
u^+(x, t) = (\partial, S(t)\varphi)(x) + (S(t)\psi)(x) + \int_0^\infty T(t-t')f(u(t')) \, dt'.
\]
Since $u, u_t \in X_{p, \theta}^s$ for $s > 2 - \frac{2}{p}$ and $\theta = \min(\frac{s-2}{2r}, \frac{1}{r})$, we have from Lemma 3.2
\[
\|u(\cdot, t) - u^+(\cdot, t)\|_{H^s} \lesssim \int_t^\infty \|f(u(\cdot, t'))\|_{H^p} \, dt' \lesssim \rho^s \int_t^\infty (1 + t')^{-s(p-1)} \, dt' = O(t^{-\theta(p-1)+1}).
\]
Similarly, we have
\[
\|u_t(\cdot, t) - u_t^+(\cdot, t)\|_{H^s} \lesssim \int_t^\infty \|f(u)(t')\|_{H^s} \, dt' = O(t^{-\theta(p-1)+1}).
\]
Since $\theta(p-1) > 1$, we have just proved the theorem. For more details, see [7].

3.2. Nonexistence of nontrivial asymptotically free solutions. Let us define a bilinear form $H(u, v)(t)$ by
\[
H(u, v)(t) = \text{Re} \int_x \left( D^{-1}u_t(t)D^{-1}v(t) - D^{-1}v_t(t)D^{-1}u(t) \right) \, dx.
\]
Then $H(u, v)(t)$ is well-defined and uniformly bounded on $t > 0$ for $(u, u_t), (v, v_t) \in L^\infty(0, \infty; DL^2 \times DL^2)$. Our strategy of proof is to use a contradiction to the uniform boundedness of $H$. Suppose that there are non-zero functions $u$ and $u^+$ satisfying the condition of Theorem 1.3. Then we obtain
\[
\frac{d}{dt}H(u, u^+)(t) = \text{Re} \int f(u)\overline{u^+} \, dx.
\]
Let $H(u, u^+)(t) = H(t)$. Then we have
\[
\frac{d}{dt}H(t) = \text{Re} \int (f(u) - f(u^+))\overline{u^+} \, dx + \text{Re} \int f(u^+)\overline{u^+} \, dx 
\geq \text{Re} \int (f(u) - f(u^+))\overline{u^+} \, dx + c \int |u^+|^{p+1} \, dx.
\]
Now using an argument in [1] and [12], we prove that if $t$ is sufficiently large,
\[
\|u^+(t)\|^2_{L^{p+1}(|x| \leq Ae^t)} \geq c_0 t^{-\frac{p}{p+1}}
\]
for some positive constant $A$ and $c_0$ depending on $\varphi^+$ and $D^{-1}\psi^+$ and $\beta > 1$ depending on $\varepsilon$. Here and after, every constant depends on $\varphi^+$ and $\psi^+$, if not specified. For the proof of (3.6), we first show that

$$
\|u^+(t)\|_{L^2(|x| \leq A t^\beta)} \gtrsim 1 \quad \text{for sufficiently large } t.
$$

Using Hölder inequality, (3.7) yields the required estimate (3.6). To obtain the $L^2$ lower bound, let us choose a cut off function $\chi_0$ supported in $(-1, 1)$ such that

$$
\|u^+(t)\|^2_{L^2(|x| \leq A t^\beta)} = t \|u^+(t, t)\|^2_{L^2(|x| \leq M)} \geq t \|\chi_0(-/M)u^+(t, t)\|^2_{L^2},
$$

where $M = A t^{\beta - 1}$. Since $u^+$ is the solution to the linear problem (1.4), for the last integral, we have

$$
\begin{align*}
&\int L^2 
&= t \|\chi_0(-/M) (\partial_t S(t)\varphi^+)(t)\|^2_{L^2} + t \|\chi_0(-/M) (S(t)\varphi^+)(t)\|^2_{L^2}
&\quad + 2t \operatorname{Re} \int \left( \chi_0(x/M) \right)^2 (\partial_t S(t)\varphi^+)(tx) (S(t)\varphi^+)(tx) \, dx.
\end{align*}
$$

By change of variable and Plancheral’s theorem, we have for the first term

$$
t \|\chi_0(-/M)(\partial_t S(t)\varphi^+)(t')\|^2_{L^2} = \left\| \chi_0(-/M) F^{-1} \left( \cos \frac{1}{\sqrt{1 + (\cdot)^2/t^2}} t^{-\frac{1}{2}} \varphi^+ (\cdot/t) \right) \right\|^2_{L^2}.
$$

From the identity $\cos^2 x = \frac{1 + \cos(2x)}{2}$, we deduce that

$$
\begin{align*}
\left\| \cos \frac{1}{\sqrt{1 + (\cdot)^2/t^2}} t^{-\frac{1}{2}} \varphi^+ (\cdot/t) \right\|^2_{L^2}
&= \int \cos^2 \left( \frac{\xi}{\sqrt{1 + \xi^2/t^2}} \right) t^{-1} \varphi^+ (\xi/t) \varphi^+ (\xi/t) \, d\xi
&= \frac{1}{2} \|\varphi^+\|^2_{L^2} + \frac{1}{2} \int \cos \left( \frac{2\xi}{\sqrt{1 + \xi^2/t^2}} \right) t^{-1} \varphi^+ (\xi/t) \varphi^+ (\xi/t) \, d\xi.
\end{align*}
$$

By the integration by parts, it follows from the Hölder inequality that

$$
\int \cos \left( \frac{2\xi}{\sqrt{1 + \xi^2/t^2}} \right) t^{-1} \varphi^+ (\xi/t) \varphi^+ (\xi/t) \, d\xi
= -\frac{1}{2t} \int \sin \left( \frac{2\xi}{\sqrt{1 + \xi^2/t^2}} \right) \partial_\xi \left( (1 + \xi^2/t^2)^{\frac{1}{2}} \varphi^+ (\xi/t) \varphi^+ (\xi/t) \right) \, d\xi
= O(t^{-1})
$$

and hence

$$
\left\| \cos \frac{1}{\sqrt{1 + (\cdot)^2/t^2}} t^{-\frac{1}{2}} \varphi^+ (\cdot/t) \right\|^2_{L^2} \to \frac{1}{\sqrt{2}} \|\varphi^+\|^2_{L^2} \quad \text{as } t \to \infty.
$$

Now we claim that there exist large numbers $t_0$ such that

$$
\inf_{t > t_0} t \|\chi_0(-/M)(\partial_t S(t)\varphi^+)(t)\|^2_{L^2} \gtrsim 1.
$$
For the proof of (3.11), we may assume that \( \|\varphi^+\|_{L^2} = 1 \). Let us define a function \( g_\ell(x) \) by \( t|\partial_x S(t)\varphi^+(tx)|^2 \). Then from (3.10), we can find a positive number \( t_0 \) such that \( \|g_\ell\|_{L^1} \geq \frac{1}{2} \) for all \( t > t_0 \). Using the integration by parts \( m \)-times, we get for \( x \neq 0 \)

\[
t^\frac{1}{2} (\partial_x S(t)\varphi^+)(tx) = \frac{1}{2\pi} \int e^{ix\xi} \cos \left( \frac{\xi}{\sqrt{1 + \xi^2/t^2}} \right) t^{-\frac{1}{2}} \varphi^+(\xi/t) d\xi
\]

\[
= \frac{1}{2\pi(-ix)^m} \int e^{ix\xi} \partial_\xi^m \left( \cos \left( \frac{\xi}{\sqrt{1 + \xi^2/t^2}} \right) t^{-\frac{1}{2}} \varphi^+(\xi/t) \right) d\xi.
\]

We then have \( g_\ell(x) \leq \frac{A t}{|x|^{\beta m}} \) for some \( A \) depending on \( \varphi^+ \). This gives us that

\[
\int (\chi_0(x/M))^2 g_\ell(x) \, dx = \int g_\ell(x) \, dx - \int (1 - (\chi_0^2(x/M))^2) g_\ell(x) \, dx
\]

\[
\geq \frac{1}{2} - \int_{|x| \geq \frac{1}{2}M} \frac{At}{|x|^{2m}} \, dx
\]

\[
\geq \frac{1}{2} - \frac{2}{2m - 1} At(1/2At^{-1})^{1 - 2m}
\]

Now if we choose \( m \) and \( \beta \) so that \( (\beta - 1)(2m - 1) > 1 \), then the claim (3.11) is proved, provided \( t_0 \) is sufficiently large.

Similarly we can prove that

\[
\left\| \left( \sin \left( \frac{(\cdot)}{\sqrt{1 + (\cdot)^2/t^2}} \right) \right) \sqrt{1 + \xi^2/t^2} t^{-\frac{1}{2}} \tilde{\varphi}^+(\cdot/t) \right\|_{L^2}^2 \to \frac{1}{\sqrt{2}} \|1 - \partial_x^2\|_D^{-1} \tilde{\varphi}^+(\cdot/t)\|_{L^2}^2
\]

as \( t \to \infty \) and hence by the same argument as above, we have the estimate

(3.12) \[
t\|\chi_0(x/M)(S(t)\varphi^+)(tx)\|_{L^2}^2 \gtrsim 1,
\]

if \( t > t_0 \) for some large \( t_0 \).

Finally, for the last term of (3.8) let us consider the integral

\[
I(t) = t \int (\partial_x S(t)\varphi^+)(tx) \overline{S(t)\varphi^+}(tx) \, dx.
\]

Then by change of variable and Plancheral’s theorem, \( I(t) \) is converted by

\[
\frac{1}{2t\pi} \int \sin \left( \frac{2\xi}{\sqrt{1 + \xi^2/t^2}} \right) \sqrt{1 + \xi^2/t^2} \frac{t^{-\frac{1}{2}} \tilde{\varphi}^+(\xi/t) \tilde{\psi}(\xi/t)}{2\xi/t} d\xi.
\]

Here we also used the identity \( \cos x \sin x = \frac{1}{2} \sin 2x \). Similarly to the estimate (3.9), we have \( I(t) = O(t^{-1}) \). With this estimate we prove that

(3.13) \[
2t \text{Re} \int (\chi_0(x/M))^2 (\partial_x S(t)\varphi^+)(tx) \overline{S(t)\varphi^+}(tx) \, dx \to 0 \quad \text{as} \quad t \to \infty.
\]
Actually, by the integration by parts as above, we have
\[
|2\text{Re} \int (\chi_0(x/M))^2(\partial_t S(t)\varphi^+)(tx)(S(t)\psi^+)(tx) \, dx|
\leq |2\text{Re} I(t)| + \int_{|x| \geq \frac{1}{2} M} \frac{At}{|x|^{2m}} \, dx \to 0
\]
as \(t \to \infty\).

Therefore (3.13) together with (3.11) and (3.12) yields the lower bound estimate (3.7) and hence (3.6).

Since \(\varphi^+\) and \(\psi^+\) are in \(\mathcal{F}^{-1}C_0^\infty(\mathbb{R} \setminus \{0\})\), it follows from the proof of Lemmas 2.2 and 2.3 that for all \(2 \leq q \leq \infty\)
\[
\|u^+(t)\|_{L^q} \lesssim t^{-(\frac{1}{2} - \frac{1}{q})}.
\]
From the estimate (3.14) and the hypothesis (1.5), we readily have for \(1 < p \leq 2\)
\[
\text{Re} \int (f(u) - f(u^+))u^+ \, dx \lesssim (\|u\|_{L^2}^{p-1}\|u^+\|_{L^2}^{2-p} + \|u^+\|_{L^2}^2)\|u^+\|_{L^\infty}^p \|u - u^+\|_{L^2}
= O(t^{-\frac{1}{2}(p-1) - \varepsilon}).
\]
Thus choosing \(\beta\) such as \(\frac{\beta(p-1)}{2} < \frac{p-1}{2} + \varepsilon\) and \(\frac{\beta(p-1)}{2} \leq 1\), we conclude from (3.6) that \(\frac{d}{dt} H(t) \gtrsim t^{-1}\) for large \(t\). This is a contradiction to the uniform boundedness of \(H\).

3.3. Remarks. The methods of proof for Theorems 1.1 and 1.2 are applicable to the high dimensional case with a slight modification of Lemma 2.1. One can treat the high dimensional version of Lemma 2.1 by using a dyadic decomposition and the method of stationary phase in the case of non-vanishing Gaussian curvature of the phase. In our problem, since the phase \(\omega = |\frac{r}{\sqrt{1+|\xi|^2}}|\) is radially symmetric, the Gaussian curvature of \(\omega\) is equivalent to the value of second derivative of \(\frac{r}{\sqrt{1+|\xi|^2}}\) (\(r = |\xi|\)). Thus we can easily obtain the high dimensional analogs of Theorems 1.1 and 1.2. As for the Theorem 1.3, using the radial symmetry, one can carry out the integration by parts with respect to the radial derivatives and hence obtain a high dimensional version of (3.7). Then by a straightforward application of the one dimensional argument, one can have the nonexistence of scattering for \(1 < p \leq 1 + \frac{2}{n}\) like Schrödinger or Klein-Gordon equation.

In the proof of Theorem 1.3, the assumption \(\|u(t) - u^+(t)\|_{L^2} = O(t^{-\varepsilon})\) was necessary for the comparison between (3.6) and (3.15). For the proof of (3.6), it was inevitable to use \(M = At^{\beta-1}\) unlike the Schrödinger case in [1] where \(M\) is just a large constant. In our problem, the dependence of \(M\) on \(t\) was caused by the reason that the norm \(\|t^{\frac{1}{2}}(\chi_0(\cdot/M))\partial_t S(t)\varphi^+(t)\|_{L^2}^2\) converges to the norm \(\frac{1}{2}\|\varphi^+\|_{L^2}^2\) but the function \(t^{\frac{1}{2}}(\chi_0(\cdot/M))\partial_t S(t)\varphi^+(t)\) itself does not converge to \(\frac{1}{2}\|\varphi^+\|_{L^2}^2\) in \(L^2\).
because the phase $\omega = \frac{\xi}{\sqrt{1+\xi^2}}$ is almost constant at high frequency. This is a difficulty different from other dispersive equations with well curved phase $\omega = |\xi|^2$ and so on. It will be very interesting to prove the nonexistence of scattering without decay assumption (1.5).
