Elliptic Bernoulli Functions And Their Identities

Tomoya Machide

Abstract. We introduce an elliptic analogue of the Bernoulli functions, which
we call elliptic Bernoulli functions. They are defined by using the modified
generating function of the elliptic polylogarithms. By degeneration of the
elliptic Bernoulli functions, we obtain standard properties and new identities
for the Bernoulli functions.

1. Introduction

As a generalization of the usual polylogarithms, A. Levin [1] studied elliptic
polylogarithms purely analytically, and introduced their generating function. In
this paper, we define elliptic Bernoulli functions by using the modified generat-
ing function of the elliptic polylogarithms, and show that they have symmetry,
periodicity, an additive formula, and transformation properties. In addition, We
get several identities for the generating function of the elliptic Bernoulli functions,
which gives identities for the elliptic Bernoulli functions. Standard properties and
new identities for the (classical) Bernoulli functions and polynomials are obtained
by degeneration of the elliptic Bernoulli functions. We note that Fourier expansions
of the elliptic Bernoulli functions are a sort of Eisenstein series.

The paper is organized as follows: In Section 2, we define the elliptic Bernoulli
functions, and give their symmetry, periodicity, an additive formula, and transfor-
mation properties. By degeneration of the elliptic Bernoulli functions, standard
properties of the Bernoulli functions and polynomials are induced. In Section 3, we
show various identities for the generating function of the elliptic Bernoulli functions,
which give birth to identities for the elliptic Bernoulli functions. By degeneration,
new identities for the Bernoulli functions are deduced.

We will use the following notations: \( e(x) := e^{2\pi \sqrt{-1} x} \), \( q := e(\tau) \), and Jacobi’s theta function

\[
\theta(x; \tau) := \sum_{m \in \mathbb{Z}} e^{\pi \sqrt{-1}(m+\frac{1}{2}) \tau + 2\pi \sqrt{-1}(m+\frac{1}{2})(x+\frac{1}{2})}.
\]

Here \( \tau \) is a complex number with positive imaginary part, i.e., \( \text{Im} \tau > 0 \).

2. Elliptic Bernoulli Functions

In this section, we give the definition and properties of elliptic Bernoulli func-
tions, and degeneration into the Bernoulli functions.

\[2000 \quad \text{Mathematics Subject Classification. Primary 11B68; Secondary 11F11.}\]
Consider the following function

\[
F_x(\xi; \tau) = 2\pi \sqrt{-1} \left[ \sum_{j=1}^{\infty} \frac{q^j}{e(x) - q^j} e(-j\xi) - \sum_{j=1}^{\infty} \frac{q^j}{e(-x) - q^j} e(j\xi) + \frac{1}{e(x) - 1} + \frac{1}{e(\xi) - 1} + 1 \right], \quad (|\text{Im } x|, |\text{Im } \xi| < \text{Im } \tau).
\]

(1)

This function has another expression ([2] p.446 , [3] Sect.3):

\[
F_x(\xi; \tau) = F_\xi(x; \tau) = \theta'(0; \tau) \theta(x + \xi; \tau) \theta(x; \tau) \theta(\xi; \tau),
\]

where \(\theta'(x; \tau) = \frac{\partial}{\partial x} \theta(x; \tau)\). Hence it has simple poles on \(\mathbb{Z} + \tau \mathbb{Z}\) and residue 1 at the origin with respect to \(x\). Periodic properties and transformation properties of \(F_x(\xi; \tau)\) are the following ([3] Sect.3):

\[
F_x(\xi + 1; \tau) = F_x(\xi; \tau), \quad F_x(\xi + \tau; \tau) = e(-x)F_x(\xi; \tau),
\]

\[
F_x(\xi; \tau) = \frac{1}{ct + d} e(-\frac{c x \xi}{ct + d}) F_{\frac{x}{ct+d}}\left(\frac{\xi}{ct+d}; \frac{at + b}{ct + d}\right),
\]

(2)

where \(a, b, c, d \in \mathbb{Z}\) such that \(ad - bc = 1\).

DEFINITION 2.1. We define the generating function \(E(x, y; \xi; \tau)\) of elliptic Bernoulli functions and the \(m\)-th elliptic Bernoulli function \(B_m(x, y; \tau)\) as

\[
E(x, y; \xi; \tau) := e(y\xi)F_{x+y\tau}(\xi; \tau) = \sum_{m=0}^{\infty} \frac{B_m(x, y; \tau)}{m!} \left(2\pi \sqrt{-1}\right)^m \xi^{m-1}.
\]

Because of (1), we have \(B_0(x, y; \tau) = 1\) and

\[
B_m(x, y; \tau) = m \left( \sum_{j=1}^{\infty} (y - j)^{m-1} \frac{q^j}{e(x - y\tau) - q^j} - \sum_{j=1}^{\infty} (y + j)^{m-1} \frac{q^j}{e(x + y\tau) - q^j} + y^{m-1} \frac{e(-x + y\tau)}{e(-x + y\tau) - 1} \right) + B_m(y),
\]

(3)

for every positive integer \(m\). Here \(B_m(y)\) is the \(m\)-th Bernoulli polynomial:

\[
2\pi \sqrt{-1} \cdot \frac{e(y\xi)}{e(\xi) - 1} = \sum_{m=0}^{\infty} \frac{B_m(y)}{m!} \left(2\pi \sqrt{-1}\right)^m \xi^{m-1}.
\]

**Remark 1** The origin of the definition of elliptic Bernoulli functions is the following. We can formally regard the function \(2\pi \sqrt{-1} \int e(y\xi)/\left(e(\xi) - 1\right)d\xi\) as the generating function of the Debye polylogarithms \(\Lambda_m(\xi)\) in the following sense (the definition of the Debye polylogarithms is in [1] Sect.1):
\[
2\pi\sqrt{-1} \int e(y\xi) \frac{1}{e(\xi) - 1} d\xi \\
= 2\pi\sqrt{-1} \int e(y\xi) \text{Li}_0(e(-\xi)) d\xi \\
= -e(y\xi) \text{Li}_1(e(-\xi)) + 2\pi\sqrt{-1}y \int e(y\xi) \text{Li}_1(e(-\xi)) d\xi \\
= \ldots \\
= -e(y\xi) \left( \sum_{m=0}^{\infty} \text{Li}_{m+1}(e(-\xi)) y^m \right) \\
= -\sum_{m=0}^{\infty} \left( \sum_{k=0}^{m} \text{Li}_{k+1}(e(-\xi)) \frac{(2\pi\sqrt{-1})^{-k} \xi^{m-k}}{(m-k)!} \right) (2\pi\sqrt{-1}y)^m \\
= \sum_{m=0}^{\infty} \Lambda_{m+1}(-\xi)(2\pi\sqrt{-1})^{m+1}(-y)^m
\]

Here \( \text{Li}_m(z) = \sum_{n=1}^{\infty} \frac{z^n}{n^m} \) is the Euler polylogarithm, and assume that the series is formal. A. Levin introduced the modified generating function \( \Lambda(\xi, \tau; x, y) \) of the elliptic polylogarithms ([1] Sect.2):

\[
\Delta(\xi, \tau; x, y) = \sum_{m,n \geq 0, n \geq 1} \Lambda_{m,n}(\xi; \tau)(-Y)^{n-1}X^m + \frac{e^{-Y\xi}}{Y(\tau - X)} + \frac{1}{(e^Y - 1)X},
\]

where \( \Lambda_{m,n}(\xi; \tau) \) is the (Debye) elliptic polylogarithm with index \((m,n)\). He also give the equation ([1] Prop.3.1)

\[
F(x, y; \xi) = \frac{\partial}{\partial \xi} \Delta(\xi, \tau; -2\pi\sqrt{-1}x, -2\pi\sqrt{-1}y).
\]

Integrating both sides of the equation above with respect to \( \xi \), we get the formula

\[
\int F(x, y; \xi; \tau) d\xi = \Delta(\xi, \tau; -2\pi\sqrt{-1}x, -2\pi\sqrt{-1}y)
\]
as a matter of form. Two facts that \( \int e(y\xi)/(e(\xi) - 1) d\xi \) is formally regarded as the generating function of the Debye polylogarithms and that \( e(y\xi)/(e(\xi) - 1) \) is the generating function of the Bernoulli functions (polynomials) suggest that \( F(x, y; \xi; \tau) \) is the generating function of elliptic Bernoulli functions (polynomials).

**Remark 2** The Fourier expansion of the elliptic Bernoulli function of degree \( m \geq 3 \) with respect to \( x, y \) is (cf. [4], [5])

\[
B_m(x, y; \tau) = - \frac{m!}{(2\pi\sqrt{-1})^m} \sum_{i,j=-\infty}^{\infty} \frac{e(i\tau + jy)}{(i\tau + j)^m}, \quad (0 \leq x, y < 1).
\]

We introduce properties of the elliptic Bernoulli functions.

**PROPOSITION 2.1.** Let \( a, b, c, d \) be integers such that \( ad - bc = 1 \), and \( m \) be a non negative integer. Then we have the following equations:
(i) (transformation property) 
\[ B_m(x, y; \tau) = \frac{1}{(c\tau + d)^m} B_m(ax + by, cx + dy; \frac{a\tau + b}{c\tau + d}). \]

(ii) (symmetry) \( B_m(x, y; \tau) = (-1)^m B_m(-x, -y; \tau). \)

(iii) (periodicity) \( B_m(x + 1, y; \tau) = B_m(x, y + 1; \tau) = B_m(x, y; \tau). \)

(iv) (additive formula) \( B_m(x, y + z; \tau) = \sum_{i=0}^{m} \binom{m}{i} B_i(x - z\tau, y; \tau) z^{m-i}. \)

**Proof.** By transformation properties of \( F_2(\xi; \tau), \) we can get 
\[ F(x, y; \xi; \tau) = \frac{1}{ct + d} F(ax + by, cx + dy; \frac{a\xi + b}{ct + d}). \]

It follows (i) from comparing the coefficient of \( \xi^m \) of the above equation. One can prove the other cases in a similar way. \( \square \)

We will show that the elliptic Bernoulli functions degenerate into the Bernoulli functions. Let \( \{y\} \) denotes the fractional part of a real number \( y, \) i.e., \( 0 \leq \{y\} < 1. \)

**Theorem 2.1.** Let \( y \) be a real number and \( m, k \) positive integers. Then the following equations hold:

(i) \( \lim_{\tau \to \infty -1} B_m(x, y; \tau) = \begin{cases} B_m(\{y\}) = (-1)^m B_m(\{-y\}), & (y \notin \mathbb{Z}), \\ B_1 + \frac{e(-x)}{e(-x) - 1}, & (y \in \mathbb{Z}, m = 1), \\ B_m, & (y \in \mathbb{Z}, m > 1), \end{cases} \]

where \( B_m = B_m(0). \)

(ii) \( \lim_{k \to \infty} B_m(x, y; \frac{k}{|y|} \tau) = B_m(\frac{y}{\tau}) + m(\frac{y}{\tau})^{m-1} \frac{e(-x)}{e(-x) - 1}, \quad (y \neq 0). \)

**Proof.** If \( \tau \) approaches \( \infty -1, \) then \( e(y\tau)q^j \) and \( e(-y\tau)q^j \) approach 0. Therefore one can prove the equation (i) for \( 0 \leq y < 1 \) because of the formula (3), which give the complete proof of (i) by virtue of periodicity and symmetry of the elliptic Bernoulli functions. The formula (ii) is derived from the equation
\[ B_m(x, y; \frac{k}{|y|} \tau) = m \left( \sum_{j=1}^{\infty} \frac{y}{\tau} + j \right)^{m-1} \frac{q^{jk}}{e(x) - q^{jk}} 
- \sum_{j=1}^{\infty} \frac{y}{\tau} + j \right)^{m-1} \frac{q^{jk}}{e(x) - q^{jk}} + \left( \frac{y}{\tau} \right)^{m-1} \frac{e(-x)}{e(-x) - 1} + B_m(\frac{y}{\tau}), \]

where \( q' = e(\frac{y}{|y|}). \)

We can deduce some properties of the Bernoulli functions and polynomials from the above proposition and theorem (i).

**Corollary 2.1.**

(i) (symmetry) \( B_m(\{y\}) = (-1)^m B_m(\{-y\}), \quad (y \in \mathbb{R}). \)

(ii) (quasi periodicity) \( B_m(y + 1) = B_m(y) + my^{m-1}. \)
(iii) (additive formula) \( B_m(x + y) = \sum_{i=0}^{m} \binom{m}{i} B_i(y)x^{m-i} \).

**Proof.** The formula (i) is already proved in the above theorem. When \( 0 < y < 1 \), the equation (ii) is deduced from
\[
\lim_{\tau \to \infty} B_m(x, y + 1; \tau) = -my^{m-1} + B_m(y + 1).
\]
One get (ii) by analyticity. As the proof of (ii), (iii) is derived from the additive formula of the elliptic Bernoulli functions.

**3. Identities**

We will give identities for the generating function of the elliptic Bernoulli functions, which imply identities for the elliptic Bernoulli functions and the (classical) Bernoulli functions. Throughout this section, we suppose that \( l, k, e_i, \ldots \) are positive integers, that \( m, m_l \) are non negative integers, and that empty product is regarded as one. We prepare the lemma below:

**Lemma 3.1.** If \( e_a = e'_a = 1 \), then we have
\[
\sum_{a=0}^{k} \frac{1}{e_a} \left[ \sum_{j=0}^{e'_a-1} \left( \sum_{i=0}^{e_a-1} F_{e'_a \xi_0 + \cdots + e'_a \xi_k} \left( l(x_a - \frac{i}{e_a} + \frac{j}{e'_a}; \frac{l}{e'_a} \tau \right) \right) \right.
\]
\[
\times \left( \prod_{b=0}^{k} F_{e_b \xi_0 + \cdots + e_b \xi_k} \left( e_b (x_b - \frac{i}{e_a} + \frac{j}{e'_a} - \frac{j}{e'_b} \tau; \frac{e_b}{e'_b} \tau \right) \right) \left( \sum_{i=0}^{e'_a-1} \left( \sum_{j=0}^{e'_b-1} \prod_{b=0}^{k} F_{e_b \xi_0 + \cdots + e_b \xi_k} \left( e_b (x_b - \frac{i}{e_a} + \frac{j}{e'_a} + \frac{j}{e'_b} \tau; \frac{e_b}{e'_b} \tau \right) \right) \right) \right]
\]
\[
= \frac{1}{l} \sum_{j=0}^{l-1} \left( \sum_{i=0}^{e'_a-1} \left( \sum_{j=0}^{e'_b-1} \prod_{b=0}^{k} F_{e_b \xi_0 + \cdots + e_b \xi_k} \left( e_b (x_b - \frac{i}{e_a} + \frac{j}{e'_a} + \frac{j}{e'_b} \tau; \frac{e_b}{e'_b} \tau \right) \right) \right) \right)
\]

**Proof.** Let \( f(x_0) \) be \( (\text{the left hand side}) - (\text{the right hand side}) \). It has quasi periodicity 1 and \( e(-l' \xi_0) \) as \( x_0 \) goes to \( x_0 + 1 \) and \( x_0 + \tau \) respectively. The left hand side has possible poles on the following lattices:
\[
\frac{1}{l} \mathbb{Z} + \frac{\tau}{l} \mathbb{Z}; \quad x_a + \frac{1}{e_a} \mathbb{Z} + \frac{\tau}{e_a} \mathbb{Z}, (a = 1, \ldots, k);
\]
\[
x_a - \frac{i}{e_a} + \frac{j}{e'_a} + \mathbb{Z} + \tau \mathbb{Z}, (a = 1, \ldots, k, \ i = 0, \ldots, e_a - 1, \ j = 0, \ldots, e'_a - 1).
\]
The right hand side has those on the following lattices:
\[
\frac{j}{l} - \frac{j}{l'} + \mathbb{Z} + \tau \mathbb{Z}, (i = 0, \ldots, l - 1, \ j = 0, \ldots, l' - 1).
\]

For generic \( x_1, \ldots, x_k \), the order of the possible poles of \( f(x_0) \) is 1 or less. By direct calculation, the function \( f(x_0) \) is an entire function with quasi periodicity 1 and \( e(-l' \xi_0) \) as \( x_0 \) goes to \( x_0 + 1 \) and \( x_0 + \tau \) respectively. Therefore it must vanish for generic \( \xi_0, x_1, \ldots, x_k \). It also vanish for all \( \xi_0, x_1, \ldots, x_k \) by analyticity.

Recall the generating function \( F(x, y; \xi) \) of the elliptic Bernoulli functions. Calculating the residue of the formula in the above lemma at \( \xi_0 = 0 \), and replacing \( x_a \)
with \(-x_a + y_a\tau\), we obtain the following identity for \(E(x, y; \xi)\):
\[
\sum_{a=1}^{k} \frac{1}{e_a} \left[ \sum_{j=0}^{k'} \sum_{i=0}^{e_{a-1}} E(l(x_a + \frac{i}{e_a}), l'(y_a + \frac{j}{e_a}); e'_1\xi_1 + \cdots + e'_k\xi_k; \frac{l}{l'}\tau) \right. \\
\times \left. \prod_{b=1}^{k} E(e_b(x_b - x_a - \frac{i}{e_a}), e'_b(y_b - y_a - \frac{j}{e_a}); l'_b\xi_b; \frac{e_b}{e'_b}\tau) \right] \\
= \frac{1}{l} \sum_{b=1}^{k} \prod_{j=0}^{l'-1} \sum_{i=0}^{e_{b-1}} E(e_b(x_b + \frac{i}{l}), e'_b(y_b + \frac{j}{l}); l'_b\xi_b; \frac{e_b}{e'_b}\tau).
\]
Multiplying \((e'_1\xi_1 + \cdots + e'_k\xi_k) \prod_{b=1}^{k} (l'_b\xi_b)\) both sides of the equation above, one can compare the coefficient of \(\xi_1^{m_1} \cdots \xi_k^{m_k}\) \((m_1, \ldots, m_k \geq 0)\). Since
\[
(e'_1\xi_1 + \cdots + e'_k\xi_k)E(l(x_a + \frac{i}{e_a}), l'(y_a + \frac{j}{e_a}); e'_1\xi_0 + \cdots + e'_k\xi_k; \frac{l}{l'}\tau) \\
= \sum_{m_1, \ldots, m_k=0}^{\infty} \mathcal{B}(l(x_a + \frac{i}{e_a}), l'(y_a + \frac{j}{e_a}; \frac{l}{l'}\tau)) \mathcal{M}(e'_1\xi_1^{m_1} \cdots e'_k\xi_k^{m_k}) \frac{m!}{m_1! \cdots m_k!}
\]
where \(\mathcal{M} = m_1 + \cdots + m_k\), we reach identities for the elliptic Bernoulli functions.

**THEOREM 3.1.** If \(k \geq 2\), then the following identities hold:

(i) \[
\frac{1}{l} \sum_{b=1}^{l'-1} \sum_{i=0}^{l-1} B(l(x_a + \frac{i}{l}), e'(y_a + \frac{j}{l}); \frac{e}{e'}\tau) \\
= \frac{e^{m-1} e_{b-1}}{e} \sum_{j=0}^{l} \sum_{i=0}^{l-1} B(l(x_a + \frac{i}{l}), l'(y_a + \frac{j}{l}); \frac{l}{l'}\tau).
\]

(ii) \[
\sum_{a=1}^{k} \frac{e'_a e_{a-1}}{e_a} \sum_{i=0}^{e_{a-1}} \sum_{j=0}^{l} \sum_{b=0}^{m_{a+b-1}} B(l(x_a + \frac{i}{e_a}), l'(y_a + \frac{j}{e_a}; \frac{l}{l'}\tau) \\
\times \prod_{b=1}^{k} \binom{m_b}{n_b} B_{m_a-n_a}(e_b(x_b - x_a - \frac{i}{e_a}), e'_b(y_b - y_a - \frac{j}{e_a}); \frac{e_b}{e'_b}\tau) e_{b-1} e_{a-1} f_{a-1} \\
= \sum_{a=1}^{k} \frac{e'_a (l_{m}+\cdots+m_{a-2}}{l} \sum_{b=0}^{l'-1} \sum_{i=0}^{l-1} \sum_{j=0}^{l} B_{m-a}(l(x_a + \frac{i}{l}), e'(y_a + \frac{j}{l}; \frac{e}{e'}\tau) \\
\times \prod_{b=1}^{k} B_{m_b}(e_b(x_b + \frac{i}{l}), e'_b(y_b + \frac{j}{l}; \frac{e_b}{e'_b}\tau),
\]
where \((N, a) = \sum_{d=1}^{k} (d_a) n_d\) and \(B_{-1}(x, y; \tau) = 0\).

we obtain new identities for the Bernoulli functions due to degeneration.
COROLLARY 3.1. Let \( k \geq 2 \) and \( y \in \mathbb{R} \). Then we have

\[
\begin{align*}
(i) & \quad l^{m-1} \sum_{j=0}^{l'-1} B_m(\{e'(y + \frac{j}{l'})\}) = e^{m-1} \sum_{j=0}^{e'-1} B_m(\{l'(y + \frac{j}{e'})\}), \quad (m \geq 2). \\
(ii) & \quad k \sum_{a=1}^{a} \sum_{j=0}^{m_{a}} \sum_{(c,a) \neq 0} B(m_{a} + m_{a} - 1(\{e'(ya - \frac{j}{a'})\})) \\
& \quad \times \prod_{b} \left( \sum_{(b,a) \neq 0} B(m_{a} - n_{b} + \frac{j}{e_{b}a}) \right) \\
& \quad = \sum_{a=1}^{k} \sum_{j=0}^{m_{a} - 2} e_{a}^{m_{a} - 2} \sum_{j=0}^{l'/2} \sum_{(b,a) \neq 0} B(m_{a} - 1(\{e_{a}'(ya - \frac{j}{l'})) \right) \prod_{b} \left( B(m_{a}'(\{e_{b}'(ya - \frac{j}{l'})\})) \right),
\end{align*}
\]

where \( (n, a) = \sum_{d=1}^{k} d_{d} n_{d} \), \( B_{-1}(y) = 0 \), and \( l'(ya - \frac{j}{a'}) \), \( e_{a}'(ya - \frac{j}{a'}) \), \( e_{a}'(ya + \frac{j}{l'}) \), \( e_{b}'(ya - \frac{j}{l'}) \), \( e_{b}'(ya + \frac{j}{l'}) \) \( \notin \mathbb{Z} \), \( (a, b = 1, \ldots, k, a \neq b) \).

Note. After this work was done, the author came to know of the preprint, "Lamé Equation, Quantum Top and Elliptic Bernoulli Polynomials" by M-P. Grosset and A.P. Veselov (arXiv:math-ph/0508068), which gives another elliptic analogue of the Bernoulli polynomials.

Acknowledgments

The author thanks Professors Hiroshi Yamashita and Youichi Shibukawa for their encouragement. He expresses his gratitude to Professor Kimio Ueno for suggesting him the identities in Section 3, and to Professor Michitomo Nishizawa for his valuable advice. He also is grateful to professor Yumiko Hironaka for reading the manuscript and for her kindness.
