Abstract. Let A and B be commuting bounded linear operators on a Hilbert space. In this paper, we study spectral area estimates for norms of $A^*B - BA^*$ when A is subnormal or p-hyponormal.

§1. Introduction

Let \mathcal{H} be a Hilbert space and $\mathcal{B}(\mathcal{H})$ the set of all bounded linear operators on \mathcal{H} . If T is a hyponormal operator in $\mathcal{B}(\mathcal{H})$ then C.R.Putnam [7] proved that $||T^*T - TT^*|| \le Area(\sigma(T))/\pi$ where $\sigma(T)$ is the spectrum of T. The second named author [5] has proved that if T is a hyponormal operator and K is in $\mathcal{B}(\mathcal{H})$ with KT = TK then

$$||T^*K - KT^*|| \le 2\{Area(\sigma(T))/\pi\}^{1/2}||K||.$$

We don't know whether the constant 2 in the inequality is best possible for a hyponormal operator. In §2, we show that the constant is not best possible for a subnormal operator.

When T is a p-hyponormal operator in $\mathcal{B}(\mathcal{H})$, A.Uchiyama [10] generalized the Putnam inequality, that is,

$$||T^*T - TT^*|| \le \phi\left(\frac{1}{p}\right) ||T||^{2(1-p)} \{Area(\sigma(T))/\pi\}^p.$$

This inequality gives the Putnam inequality when p = 1. In §3, we generalize the above inequality for the spectral area estimate of $||T^*K - KT^*||$ when TK = KT. H.Alexander [1] proved the following inequality for a uniform algebra A. If f is in A then

$$dist(\bar{f}, A) \leq \{Area(\sigma(f))/\pi\}^{1/2}.$$

The second named author [5] gave an operator version for the Alexander inequality. This was used in order to estimate $||T^*K - KT^*||$ when T is a hyponormal operator and KT = TK. We also give an Alexander inequality for a p-hyponormal and we use it to estimate $||T^*K - KT^*||$.

In §4, we try to estimate $||T^*K - KT^*||$ for arbitrary contraction. In §5, we show a few results about area estimates for p-quasihyponormal operators, restricted shifts and analytic Toeplitz operators.

For 0 , <math>T is said to be p-hyponormal if $(T^*T)^p - (TT^*)^p \ge 0$. A 1-hyponormal operator is hyponormal. For an algebra \mathcal{A} in $\mathcal{B}(\mathcal{H})$, let $lat\mathcal{A}$ be the lattice of all \mathcal{A} -invariant projections. For a compact subset X in \mathcal{L} , rat(X) denotes the set of all rational functions on X.

§2. Subnormal operator

In order to prove Theorem 1, we use the original Alexander inequality.

Theorem 1. Let T be a subnormal operator in $\mathcal{B}(\mathcal{H})$ and f a rational function on $\sigma(T)$ whose poles are not on it. Then

$$||T^*f(T) - f(T)T^*|| \le \{Area(\sigma(T))/\pi\}^{1/2} \{Area(\sigma(f(T)))/\pi\}^{1/2}.$$

Proof. Suppose that $N \in \mathcal{B}(\mathcal{K})$ is a normal extension of $T \in \mathcal{B}(\mathcal{H})$ and P is an orthogonal projection from \mathcal{K} to \mathcal{H} . Then $T = PN \mid \mathcal{H}$ and so

$$T^*f(T) - f(T)T^*$$
= $PN^*Pf(N)P - Pf(N)PN^*P$
= $PN^*f(N)P - Pf(N)PN^*P$
= $Pf(N)N^*P - Pf(N)PN^*P$
= $Pf(N)(1 - P)N^*P$
= $Pf(N)(1 - P) \cdot (1 - P)N^*P$

because f(N)P = Pf(N)P and $f(N)N^* = N^*f(N)$.

Let F be a rational function in $rat(\sigma(T))$. Put \mathcal{B}_F = the norm closure of $\{g(F(N)) : g \in rat(\sigma(F(N)))\}$ then P belongs to $lat\mathcal{B}_F$. Hence

$$\| (1 - P)F(N)^*P \|$$

$$\leq dist(F(N)^*, \mathcal{B}_F) \leq dist(\bar{z}, rat(\sigma(F(N))))$$

$$\leq \{Area(\sigma(F(N)))/\pi\}^{1/2}$$

by the Alexander's theorem [1]. Hence, applying F to F=z or F=f

$$\| T^*f(T) - f(T)T^* \|$$

$$\leq \| (1-P)f(N)^*P \| \cdot \| (1-P)N^*P \|$$

$$\leq \{Area(\sigma(f(N)))/\pi\}^{1/2} \{Area(\sigma(N))/\pi\}^{1/2}$$

$$\leq \{Area(\sigma(f(T)))/\pi\}^{1/2} \{Area(\sigma(T))/\pi\}^{1/2}.$$

If T is a cyclic subnormal operator and KT = TK then using a theorem of T.Yoshino [12] we can prove that

$$||T^*K - KT^*|| \le \{Area(\sigma(T))/\pi\}^{1/2} \{Area(\sigma(K))/\pi\}^{1/2}.$$

The proof is almost same to one of Theorem 1.

$\S 3. p$ -hyponormal

In order to prove Theorem 2, we use an operator version of the Alexander inequality for a p-hyponormal operator. Unfortunately Lemma 3 is not best possible for p = 1 (see [5]). Lemma 1 is due to W.Arveson [2, Lemma 2] and Lemma 2 is due to A.Uchiyama [11, Theorem 3].

We need the following notation to give Theorem 2 and Proposition 1. Let ϕ be a positive function on $(0, \infty)$ such that

$$\phi(t) = \begin{cases} t & \text{if } t \text{ is an integer} \\ t+2 & \text{if } t \text{ is not an integer.} \end{cases}$$

We write $\ell^2 \otimes \mathcal{H}$ for the Hilbert space direct sum $\mathcal{H} \oplus \mathcal{H} \oplus \cdots$, and $1 \otimes T$ denotes the operator $T \oplus T \oplus \cdots \in \mathcal{B}(\ell^2 \otimes \mathcal{H})$ for each operator $T \in \mathcal{B}(\mathcal{H})$.

Lemma 1. Let A be an arbitrary ultra-weakly closed subalgebra of $\mathcal{B}(\mathcal{H})$ containing 1, and let $T \in \mathcal{B}(\mathcal{H})$. Then

$$dist(T, \mathcal{A}) = \sup\{\|(1 - P)(1 \otimes T)P\| ; P \in lat(1 \otimes \mathcal{A})\}.$$

Lemma 2. If T is a p-hyponormal operator, then

$$||T^*T - TT^*|| \le \phi\left(\frac{1}{p}\right) ||T||^{2(1-p)} \{Area(\sigma(T))/\pi\}^p.$$

Lemma 3. If T is a p-hyponormal operator then

$$dist(T^*, \mathcal{A}) \le \sqrt{2\phi \left(\frac{1}{p}\right)} ||T||^{1-p} \left\{ Area(\sigma(T)) / \pi \right\}^{p/2}$$

where A is the strong closure of $\{f(T) ; f \in rat(\sigma(T))\}.$

Proof. Let $S=1\otimes T$. Then S is p-hyponormal. In order to prove the lemma, by Lemma 1 it is enough to estimate $\sup\{\|(1-P)SP\|\ ;\ P\in lat(1\otimes \mathcal{A})\}$. If $P\in lat(1\otimes \mathcal{A})$ then SP=PSP and so

$$||(1-P)SP||^{2}$$

$$= ||PSS^{*}P - PSPS^{*}P||$$

$$= ||PSS^{*}P - PS^{*}SP + PS^{*}SP - PSPS^{*}P||$$

$$\leq ||P(S^{*}S - SS^{*})P|| + ||(PSP)^{*}(PSP) - (PSP)(PSP)^{*}||$$

$$\leq ||S^{*}S - SS^{*}|| + ||(PSP)^{*}(PSP) - (PSP)(PSP)^{*}||.$$

By [11, Lemma 4], PSP is p-hyponormal and so by Lemma 2 we have

$$\begin{split} & \|PSS^*P - PSPS^*P\|^2 \\ & \leq \phi\left(\frac{1}{p}\right) \|T\|^{2(1-p)} \{Area(\sigma(T))/\pi\}^p + \phi\left(\frac{1}{p}\right) \|PSP\|^{2(1-p)} \{Area(\sigma(PSP))/\pi\}^p \\ & \leq 2\phi\left(\frac{1}{p}\right) \|T\|^{2(1-p)} \{Area(\sigma(T))/\pi\}^p \end{split}$$

because $||PSP|| \le ||S|| = ||T||$ and $\sigma(PSP) \subset \sigma(S) = \sigma(T)$. By Lemma 1,

$$dist(T^*, \mathcal{A}) \leq \sqrt{2\phi\left(\frac{1}{p}\right)} ||T||^{1-p} \{Area(\sigma(T))/\pi\}^{p/2}.$$

Theorem 2. If T is a p-hyponormal operator in $\mathcal{B}(\mathcal{H})$ and if K is in $\mathcal{B}(\mathcal{H})$ with KT = TK, then

$$||T^*K - KT^*|| \le 2\sqrt{2\phi\left(\frac{1}{p}\right)}||T||^{1-p}\{Area(\sigma(T))/\pi\}^{p/2}||K||.$$

Proof. When \mathcal{A} is the strong closure of $\{f(T) ; f \in rat(\sigma(T))\}$, for any $A \in \mathcal{A}$

$$||T^*K - KT^*|| = ||(T^* - A)K + AK - KT^*|| \le 2||T^* - A|||K||.$$

Now Lemma 3 implies the theorem.

In Theorem 2, if p = 1, that is, T is hyponormal then $||T^*K - KT^*|| \le 2\sqrt{2}\{Area(\sigma(T))/2\}^{1/2}||K||$. The constant $2\sqrt{2}$ is not best because the second author [5] proved that $||T^*K - KT^*|| \le 2\{Area(\sigma(T))/2\}^{1/2}||K||$. If $p = \frac{1}{2}$, that is, T is semi-hyponormal then $||T^*K - KT^*|| \le 4||T||^{1/2}\{Area(\sigma(T))/\pi\}^{1/4}||K||$.

§4. Norm estimates

In general, it is easy to see that $||T^*T - TT^*|| \le ||T||^2$. By Theorem 1, if T is subnormal and f is an analytic polynomial then

$$||T^*f(T) - f(T)T^*|| \le ||T|| ||f(T)||.$$

In this section, we will prove that $||T^*T^n - T^nT^*|| \le ||T||^{n+1}$ for arbitrary T in $\mathcal{B}(\mathcal{H})$.

Theorem 3. If T is a contraction on \mathcal{H} and f is an analytic function on the closed unit disc \bar{D} then $||T^*f(T) - f(T)T^*|| \le \sup_{z \in D} |f(z)|$.

Proof. By a theorem of Sz.-Nagy [6], there exists a unitary operator U on \mathcal{K} such that \mathcal{K} is a Hilbert space with $\mathcal{K} \supseteq \mathcal{H}$ and $T^n = PU^n \mid \mathcal{K}$ for $n \geq 0$ where P is an orthogonal projection from \mathcal{K} to \mathcal{H} . Then it is known that $U^*P = PU^*P$ and $f(T) = Pf(U) \mid \mathcal{H}$. Hence

$$T^*f(T) - f(T)T^*$$

$$= PU^*Pf(U)P - Pf(U)PU^*P$$

$$= PU^*Pf(U)P - Pf(U)U^*P$$

$$= PU^*(I - P)f(U)P$$

because $U^*P = PU^*P$ and $f(U)U^* = U^*f(U)$. Therefore

$$\parallel T^* f(T) - f(T) T^* \parallel$$
= $\parallel P U^* (I - P) f(U) P \parallel \le \sup_{z \in D} |f(z)|$.

Corollary 1. If T is in $\mathcal{B}(\mathcal{H})$ then for any $n \geq 1 \quad || T^*T^n - T^nT^* || \leq || T ||^{n+1}$. Proof. Put A = T/||T|| then A is a contraction and so by Theorem 2 $||A^*A^n - A^nA^*|| \leq 1$ and so $||T^*T^n - T^nT^*|| \leq ||T||^{n+1}$.

§5. Remarks

In this section, we give spectral area estimates for p-quasihyponomal operators, restricted shifts and analytic Toeplitz operators.

For 0 is said to be <math>p-quasihyponormal if $T^*\{(T^*T)^p - (TT^*)^p\}T \ge 0$. A 1-quasihyponormal operator is called quasihyponormal.

Lemma 4. Let T be p-quasihyponormal and P be a projection such that TP = PTP. Then PTP is also p-quasihyponormal.

Proof. Since T is p-quaihyponormal, $T^*(T^*T)^pT \geq T^*(TT^*)^pT$. Hence, we have

$$PT^*(T^*T)^pTP \ge PT^*(TT^*)^pTP.$$

Since by the Hansen's inequality [4]

$$PT^*(T^*T)^pTP = (PTP)^*P(T^*T)^pP(PTP)$$

$$\leq (PTP)^*(PT^*TP)^p(PTP)$$

$$= (PTP)^*\{(PTP)^*(PTP)\}^p(PTP)$$

and by 0

$$PT^*(TT^*)^pTP \ge (PT^*P)(TPT^*)^p(PTP)$$

= $(PTP)^*\{(PTP)(PTP)^*\}^p(PTP),$

we have

$$(PTP)^*\{(PTP)^*(PTP)\}^p \ge (PTP)^*\{(PTP)(PTP)^*\}^p(PTP).$$

Hence, PTP is p-quasihyponormal.

Proposition 1. If T is a p-quasihyponormal operator in $\mathcal{B}(\mathcal{H})$ and if K is in $\mathcal{B}(\mathcal{H})$ with KT = TK, then

$$||T^*K - KT^*|| \le 4 \left[\phi\left(\frac{1}{p}\right) \right]^{1/4} ||T||^{1-p/2} \{Area(\sigma(T))/\pi\}^{p/4} ||K||.$$

In particular, if T is quasihyponormal then

$$||T^*K - KT^*|| \le 4||T||^{1/2} \{Area(\sigma(T))/\pi\}^{1/4} ||K||.$$

Proof. We can prove it as in the proof of Theorem 2. By [11, Theorem 6], $||T^*T - TT^*|| \le 2||T||^{2-p} \sqrt{\phi(\frac{1}{p})} \{Area(\sigma(T))/\pi\}^{p/2}$. Hence by Lemma 4

$$dist(T^*, \mathcal{A}) \le 2||T||^{1-\frac{p}{2}}\phi\left(\frac{1}{p}\right)^{\frac{1}{4}} \{Area(\sigma(T))/\pi\}^{p/4}.$$

This implies the proposition.

Let H^2 and H^∞ be the usual Hardy spaces on the unit circle and z the coordinate function. M denotes an invariant subspace of H^2 under the multiplication by z. By the well known Beurling theorem, $M=qH^2$ for some inner function. Suppose N is the orthogonal complement of M in H^2 . For a function ϕ in H^∞ , S_ϕ is an operator on N such that $S_\phi f = P(\phi f)$ $(f \in N)$ where P is the orthogonal projection from H^2 to N. For a symbol ϕ in L^∞ , T_ϕ denotes the usual Toeplitz operator on H^2 .

Proposition 2. Suppose $\Phi = q\bar{\phi}$ belongs to H^{∞} . Then

- (1) $|| S_{\phi}^* S_{\phi} S_{\phi} S_{\phi}^* || \le Area(\overline{\Phi(D)})/\pi ;$
- (2) $\|S_{\phi}^* S_{\phi}^n S_{\phi}^n S_{\phi}^*\| \le \{Area(\overline{\Phi(D)})/\pi\}^{n+1} \text{ for } n \ge 0.$

Proof. By a well known theorem of Sarason [8].

$$|| S_{\phi} || = || \phi + qH^{\infty} || = || \bar{q}\phi + H^{\infty} || = || \bar{\Phi} + H^{\infty} ||.$$

By Nehari's theorem [6], $\|\bar{\Phi} + H^{\infty}\| = \|H_{\bar{\Phi}}\|$ where $H_{\bar{\Phi}}$ denotes a Hankel operator from H^2 to $\bar{z}\bar{H}^2$. Since $\|H_{\bar{\Phi}}\|^2 = \|T_{\Phi}^*T_{\Phi} - T_{\Phi}T_{\Phi}^*\|$ where T_{Φ} denotes a Toeplitz operator on H^2 , by the Putnam inequality

$$\parallel T_{\Phi}^* T_{\Phi} - T_{\Phi} T_{\Phi}^* \parallel \leq Area(\sigma(T_{\Phi}))/\pi = Area(\overline{\Phi(D)})/\pi.$$

Now since $||S_{\phi}^*S_{\phi} - S_{\phi}S_{\phi}^*|| \le ||S_{\phi}||^2$, (1) follows. (2) is also clear by the proof above and Corollary 1.

Proposition 3. Suppose f and g are in H^{∞} . Then

$$||T_f^*T_q - T_qT_f^*|| \le \{Area(\overline{f(D)})/\pi\}^{1/2} \{Area(\overline{g(D)})/\pi\}^{1/2}$$

Proof. It is easy to see that $T_f^*T_g - T_gT_f^* = H_{\bar{q}}^*H_{\bar{f}}$. Hence

$$||T_f^*T_g - T_gT_f^*|| \le ||H_{\bar{g}}|| \cdot ||H_{\bar{f}}||.$$

Since $H_{\bar{f}}^*H_{\bar{f}}=T_f^*T_f-T_fT_f^*$, by the Putnam inequalty

$$||T_f^*T_g - T_gT_f^*|| \le \{Area(\overline{f(D)})/\pi\}^{1/2} \{Area(\overline{g(D)})/\pi\}^{1/2}.$$
