Abstract

In this paper we consider the curves in the unit 3-sphere. The unit 3-sphere can be canonically embedded in the lightcone and de Sitter 4-space in Lorentz-Minkowski 5-space. We investigate these curves in the framework of the theory of Legendrian dualities between pseudo-spheres in Lorentz-Minkowski 5-space.

1 Introduction

It has been investigated the evolutes of curves in the unit 2-sphere in [7] from the view point of the Legendrian duality [4, 5]. It is known that the evolute of a curve in the unit 2-sphere is the dual of the tangent indicatrix of the original curve [11]. The dual curve in the unit 2-sphere is defined to be equidistant by \(\pi/2\) from the original one. For a curve in the unit 3-sphere, however, the dual is a surface. Therefore, the dual of the tangent indicatrix of a curve is a surface which is called the focal surface (or, the focal set) of the original curve. The critical locus of the focal surface is the evolute of the original curve (cf., [11]). We remark that the focal set of a curve in the unit 2-sphere is a curve which is equal to the evolute.

On the other hand, the first author introduced the mandala of Legendrian dualities between pseudo-spheres in Minkowski space [4, 5]. There are three kinds of pseudo-spheres in Lorentz-Minkowski 5-space (i.e., the hyperbolic space, the de Sitter space and the lightcone). Especially, if we investigate spacelike submanifolds in the lightcone, those Legendrian dualities are essentially useful (see, also [9]). For the de Sitter space and the lightcone in Lorentz-Minkowski 5-space, there exist naturally embedded unit 3-spheres. In this paper we investigate the curves in the unit 3-sphere in the framework of the theory of Legendrian dualities between pseudo-spheres in Lorentz-Minkowski 5-space ([1, 2, 6, 5, 10, 11, 12, 13], etc.). If we have a regular curve in the unit 3-sphere, then we have the regular curve in the embedded unit 3-sphere in the lightcone or de Sitter space. Therefore, we naturally have the dual hypersurfaces in the lightcone as an application of the duality theorem in [5]. There are two kinds of lightcone dual hypersurfaces of a curve in the unit 3-sphere. The critical value sets of these two hypersurfaces are called the lightcone focal surfaces respectively. The projections of these focal surfaces to unit 3-sphere are different surfaces. In [7] we have shown that the projection images of the critical value sets of lightcone dual surfaces for a curve in the unit 2-sphere coincide with the evolute of the original curve. Therefore, the situation of curves in the unit 3-sphere is quite different from that of curves in the unit 2-sphere. However, the projections of the critical sets of lightcone focal surfaces are equal to the evolute of the curve. In order to clarify such situation, we introduce the notion of discriminant set of higher order for unfoldings of functions of one-variable (see, Section 6).

A brief description of the organization for this paper is as follows: In Section 2, we give basic concepts in this paper. In Section 3, we formulate the Frenet-Serret type formulae for the curves in the unit 3-sphere. We also give the definition of the spherical focal surfaces of the curve in the unit 3-sphere. The spherical evolutes of the curve in the unit 3-sphere is given by the critical sets of the spherical focal surfaces. In Section 4, we define the lightcone dual
hypotheses and the lightcone focal surfaces of the curves in the unit 3-sphere. In Section 5, we calculate the conditions for the $A_k (k = 1, 2, 3, 4)$ singularities for the lightcone height functions of the curves in the unit 3-sphere. In Section 6, we show that the projections of the critical sets of focal surfaces to the unit 3-sphere are the same, and they are equal to the spherical evolutes of the curve in the unit 3-sphere (Theorem 6.2). We also study the singularities of the lightcone dual surfaces, the lightcone focal surfaces and the spherical evolutes of the curves in the unit 3-sphere which is one of the main results in this paper (cf., Theorem 6.9).

All maps considered here are of class $C^\infty$ unless otherwise stated.

2 Basic concepts

In this section we give the basic concepts in this paper. Let $\mathbb{R}^5$ be a five-dimensional vector space. For any two vectors $x = (x_0, x_1, x_2, x_3, x_4), y = (y_0, y_1, y_2, y_3, y_4)$ in $\mathbb{R}^5$, their pseudo scalar product is defined by $\langle x, y \rangle = -x_0 y_0 + x_1 y_1 + x_2 y_2 + x_3 y_3 + x_4 y_4$. The pair $(\mathbb{R}^5, \langle \cdot, \cdot \rangle)$ is called Lorentz-Minkowski 5-space. We denote it as $\mathbb{R}^5_1$.

For any four vectors $x = (x_0, x_1, x_2, x_3, x_4), y = (y_0, y_1, y_2, y_3, y_4), z = (z_0, z_1, z_2, z_3, z_4), w = (w_0, w_1, w_2, w_3, w_4) \in \mathbb{R}^5_1$, their pseudo vector product is defined by

$$x \wedge y \wedge z \wedge w = \begin{vmatrix} -e_0 & e_1 & e_2 & e_3 & e_4 \\ x_0 & x_1 & x_2 & x_3 & x_4 \\ y_0 & y_1 & y_2 & y_3 & y_4 \\ z_0 & z_1 & z_2 & z_3 & z_4 \\ w_0 & w_1 & w_2 & w_3 & w_4 \end{vmatrix},$$

where $\{e_0, e_1, e_2, e_3, e_4\}$ is the canonical basis of $\mathbb{R}^5_1$. A non-zero vector $x \in \mathbb{R}^5_1$ is called spacelike, lightlike or timelike if $\langle x, x \rangle > 0, \langle x, x \rangle = 0$ or $\langle x, x \rangle < 0$ respectively. The norm of $x \in \mathbb{R}^5_1$ is defined by $\| x \| = (\text{sign}(x) \langle x, x \rangle)^{1/2}$, where $\text{sign}(x)$ denotes the signature of $x$ which is given by $\text{sign}(x) = 1, 0$ or $-1$ when $x$ is a spacelike, lightlike or timelike vector respectively.

Let $\gamma : I \to \mathbb{R}^5_1$ be a regular curve in $\mathbb{R}^5_1$ (i.e., $\dot{\gamma}(t) \neq 0$ for any $t \in I$), where $I$ is an open interval. For any $t \in I$, the curve $\gamma$ is called spacelike, lightlike or timelike if $\langle \dot{\gamma}(t), \gamma(t) \rangle > 0, \langle \dot{\gamma}(t), \gamma(t) \rangle = 0$ or $\langle \dot{\gamma}(t), \gamma(t) \rangle < 0$ respectively. We call $\gamma$ a nonlightlike curve if $\gamma$ is a spacelike or timelike curve. The arc-length of a nonlightlike curve $\gamma$ measured from $\gamma(t_0)(t_0 \in I)$ is $s(t) = \int_{t_0}^t \| \dot{\gamma}(t) \| \, dt$.

The parameter $s$ is determined such that $\| \gamma'(s) \| = 1$ for the nonlightlike curve, where $\gamma'(s) = d\gamma ds(s)$ is the unit tangent vector of $\gamma$ at $s$. We define the de Sitter 4-space by

$$S^4_+ = \{ x \in \mathbb{R}^5_1 \mid \langle x, x \rangle = 1 \}.$$ 

We define the closed lightcone with the vertex $a$ by

$$LC_a = \{ x \in \mathbb{R}^5 \mid \langle x - a, x - a \rangle = 0 \}.$$ 

We define the open lightcone at the origin by

$$LC^* = \{ x \in \mathbb{R}^5_1 \setminus \{0\} \mid \langle x, x \rangle = 0 \}.$$ 

Here we consider the unit sphere in the lightcone defined by

$$S^3_+ = \{ x \in LC^* \mid x_0 = 1 \} = \{ x \in \mathbb{R}^5_1 \mid x_0 = 1, x_1^2 + x_2^2 + x_3^2 + x_4^2 = 1 \},$$

3
we call it the lightlike unit sphere. We define the canonical lightcone projection \( \pi : LC^* \rightarrow S^3_+ \) by
\[
\pi(x_0, x_1, x_2, x_3, x_4) = \left(1, \frac{x_1}{x_0}, \frac{x_2}{x_0}, \frac{x_3}{x_0}, \frac{x_4}{x_0}\right).
\]
We also define the 3-dimensional Euclidean unit 3-sphere in \( \mathbb{R}^4_0 \) by
\[
S^3_0 = \{ x \in \mathbb{R}^5 \mid x_0 = 0, \ x_1^2 + x_2^2 + x_3^2 + x_4^2 = 1 \},
\]
where \( \mathbb{R}^4_0 = \{ x \in \mathbb{R}^5 \mid x_0 = 0 \} \) is the Euclidean 4-space.

### 3 Curves in the unit 3-sphere and focal surfaces

Let \( \gamma : I \rightarrow S^3_+ \) be a regular curve. We have a map \( \Phi : S^3_+ \rightarrow S^3_0 \) defined by \( \Phi(v) = v - e_0 \), which is an isometry. Then we have a regular curve \( \overline{\gamma} : I \rightarrow S^3_0 \) defined by \( \overline{\gamma}(s) = \Phi(\gamma(s)) = \gamma(s) - e_0 \), so that \( \gamma \) and \( \overline{\gamma} \) have completely the same geometric properties as spherical curves. Since \( \overline{\gamma} \) is a spacelike curve, we can reparameterize it by the arc-length \( s \). So we have the unit tangent vector \( t(s) = \overline{\gamma}'(s) \) of \( \overline{\gamma}(s) \). Suppose that \( \| \overline{\gamma}'(s) \| \neq 1 \). Then \( \| \overline{\gamma}'(s) + \overline{\gamma}(s) \| \neq 0 \), so that we have another unit vector \( n(s) = \frac{\overline{\gamma}'(s) + \overline{\gamma}(s)}{\| \overline{\gamma}'(s) + \overline{\gamma}(s) \|} \). We also define a unit vector by \( b(s) = \overline{\gamma}'(s) \wedge e_0 \wedge t(s) \wedge n(s) \), then we have a pseudo-orthonormal frame field \( \{ \overline{\gamma}(s), t(s), n(s), b(s) \} \) of \( \mathbb{R}^4_0 \) along \( \overline{\gamma}(s) \). By standard arguments, we have the following Frenet-Serret type formulae.

\[
\begin{align*}
\overline{\gamma}'(s) &= t(s) \\
\overline{\gamma}''(s) &= \kappa_g(s) n(s) - \overline{\gamma}(s) \\
n'(s) &= -\kappa_g(s) t(s) + \tau_g(s) b(s) \\
b'(s) &= -\tau_g(s) n(s)
\end{align*}
\]

where \( \kappa_g(s) = \| \overline{\gamma}'(s) + \overline{\gamma}(s) \| \) and \( \tau_g(s) = -\det(\overline{\gamma}(s), \overline{\gamma}'(s), \overline{\gamma}''(s), \overline{\gamma}'''(s))/\kappa_g^2(s) \). We call \( \{ \overline{\gamma}, t, n, b \} \) a Sabban frame of \( \overline{\gamma} \) [8]. Here, \( \kappa_g \) is called a geodesic curvature and \( \tau_g \) a geodesic torsion of \( \overline{\gamma} \) in \( S^3_0 \) respectively.

We now consider the focal surface of a curve \( \overline{\gamma} : I \rightarrow S^3_0 \) analogous to the case for curves in Euclidean space. We define \( F^\pm : I \times J \rightarrow S^3_0 \) by
\[
F^\pm(s, u) = u \overline{\gamma}(s) + \frac{u}{\kappa_g(s)} n(s) \pm \frac{\sqrt{\kappa_g^2(s) - u^2(\kappa_g^2(s) + 1)}}{\kappa_g(s)} b(s).
\]
We call each image of \( F^\pm \) the spherical focal surface of \( \overline{\gamma} \). We remark that the focal surfaces of \( \overline{\gamma} \) satisfies the equations \( \langle \overline{\gamma}'(s), F^\pm(s, u) \rangle = \langle \overline{\gamma}'(s), F^\pm(s, u) \rangle = 0 \). This means that each one of the focal surface \( F^\pm(s, u) \) of \( \gamma \) is the spherical dual of \( t \) in the sense of [10]. By straightforward
calculations, we have
\[
\frac{\partial F^\pm}{\partial u}(s, u) = \tau(s) + \frac{1}{\kappa_g(s)}n(s) \pm \frac{-u(\kappa_g^2(s) + 1)}{\kappa_g(s)\sqrt{\kappa_g^2(s) - u^2(\kappa_g^2(s) + 1)}}b(s)
\]
\[
\frac{\partial F^\pm}{\partial s}(s, u) = -\frac{u\kappa'_g(s) \pm \tau_g(s)\kappa_g(s)\sqrt{\kappa_g^2(s) - u^2(\kappa_g^2(s) + 1)}}{\kappa_g^2(s)}n(s)
\]
\[
+ \frac{u\tau_g(s)\kappa_g(s)\sqrt{\kappa_g^2(s) - u^2(\kappa_g^2(s) + 1)} \pm u^2\kappa'_g(s)}{\kappa_g^2(s)\sqrt{\kappa_g^2(s) - u^2(\kappa_g^2(s) + 1)}}b(s).
\]

It follows that \(\{\partial F^\pm/\partial u, \partial F^\pm/\partial s\}\) is linearly dependent if and only if
\[
\tau_g(s)\kappa_g(s)\sqrt{\kappa_g^2(s) - u^2(\kappa_g^2(s) + 1)} \pm u\kappa'_g(s) = 0,
\]
so that we have
\[
u = \frac{\pm\tau_g(s)\kappa_g^2(s)}{\sqrt{\kappa_g^2(s) + \kappa_g^4(s)\tau_g^2(s) + \kappa_g^2(s)\tau_g^2(s)}}.
\]

Therefore each critical value set of \(F^\pm\) is given by
\[
\varepsilon_{\tau}^\pm(s) = \frac{\pm\tau_g(s)\kappa_g^2(s)}{\sqrt{\kappa_g^2(s) + \kappa_g^4(s)\tau_g^2(s) + \kappa_g^2(s)\tau_g^2(s)}} \left\{ \tau(s) + \frac{1}{\kappa_g(s)}n(s) + \left(\frac{1}{\kappa_g(s)}\right)' \frac{1}{\tau_g(s)}b(s) \right\}.
\]

We remark that each curve of \(\varepsilon_{\tau}^\pm\) satisfies the equations
\[
\langle \tau'(s), \varepsilon_{\tau}^\pm(s) \rangle = \langle \tau''(s), \varepsilon_{\tau}^\pm(s) \rangle = \langle \tau'''(s), \varepsilon_{\tau}^\pm(s) \rangle = 0.
\]

In [11] Porteous introduced the notion of the evolute of \(\tau\) in the unit 3-sphere. He defined it as the curve satisfies the above equations, so that we call each image of \(\varepsilon_{\tau}^\pm\) the spherical evolute of \(\tau\) in the unit 3-sphere. We remark that \(\varepsilon_{\tau}^+(s) = -\varepsilon_{\tau}^-(s)\). For \(s = s_0\), we fix that \(v_0^+ = \varepsilon_{\tau}^+(s_0)\) and \(\langle \tau(s_0), \varepsilon_{\tau}^+(s_0) \rangle = c^+\). Since \(v_0^- = -v_0^+\) and \(c^- = -c^+\), we have a hyperplane
\[
HP(v_0^+, c^+) = \{x \in \mathbb{R}^4 \mid \langle x, v_0^+ \rangle = c^+\} = \{x \in \mathbb{R}^4 \mid \langle x, v_0^- \rangle = c^-\} = HP(v_0^-, c^-),
\]
so that we have
\[
S^2(v_0^+, c^+) = HP(v_0^+, c^+) \cap S^3.
\]

We call \(S^2(v_0^+, c^+)\) an osculating sphere of \(\tau\) at \(s_0\). Therefore the spherical evolutes \(\varepsilon_{\tau}^\pm(s)\) are the loci of the centers of osculating spheres of \(\tau\) respectively.

**Proposition 3.1.** There exists a sphere \(S^2(v, c) \subset S^3\) such that \(\tau(I) \subset S^2(v, c)\) if and only if both of the spherical evolutes \(\varepsilon_{\tau}^\pm\) are constant.

**Proof.** If one of the spherical evolutes \(\varepsilon_{\tau}^\pm\) of \(\tau\) is constant, we can set that \(\varepsilon_{\tau}^+(s) = v^+\). In this case another spherical evolute \(\varepsilon_{\tau}^-\) is constant too. Then \(\langle \tau(s), v^+ \rangle = \langle \tau(s), v^+ \rangle = \langle t(s), \varepsilon_{\tau}^+(s) \rangle = 0\), so we have \(\langle \tau(s), v^+ \rangle = c^+\) and \(\langle \tau(s), v^- \rangle \subset S^2(v^+, c^+)\). On the contrary, if \(\tau(I) \subset S^2(v, c)\), then at any point on \(\tau\), the osculating spheres is \(S^2(v, c)\) itself. So the locus of the centers of osculating spheres of \(\tau\) is \(v\) and \(-v\). Therefore, both of the spherical evolutes \(\varepsilon_{\tau}^\pm\) of \(\tau\) are constant.
4 Lightcone duals of curves in the unit 3-sphere

In [5] the first author introduced the Legendrian dualities between pseudo-spheres in Minkowski space which is a basic tool for the study of hypersurfaces in pseudo-spheres in Minkowski space. We define one-forms \( \langle dv, w \rangle = -w_0dv_0 + \sum_{i=1}^4 w_idv_i \), \( \langle v, dw \rangle = -v_0dv_0 + \sum_{i=1}^4 v_idw_i \) in \( \mathbb{R}^5 \times \mathbb{R}^5 \) and consider the following two double fibrations:

(1)\( \mathcal{L}^* \times S^3_+ \supset \Delta_3 = \{(v, w) \mid \langle v, w \rangle = 1\} \),
(2)\( \mathcal{L}^* \times \mathcal{L}^* \supset \Delta_4 = \{(v, w) \mid \langle v, w \rangle = -2\} \).

Moreover those contact manifolds are contact diffeomorphic to each other. In [5] we have the following two double fibrations:

\( \pi_{31} : \Delta_3 \rightarrow \mathcal{L}^*, \pi_{32} : \Delta_3 \rightarrow S^3_+ \),
\( \theta_{31} = \langle dv, w \rangle|_{\Delta_3}, \theta_{32} = \langle v, dw \rangle|_{\Delta_3} \).

Proof. Consider the mapping \( \mathcal{L}_3(s, u, v) = (\mathcal{L}^e(s, u, v), \varphi(s)) \). Then we have the following proposition.

\( \mathcal{L}_3 \theta_{32} = (\mathcal{L}^e(s, u, v), \varphi(s))ds = (\mathcal{L}^e(s, u, v), t(s))ds = 0 \).

Then we have the following proposition.

**Proposition 4.1.** Under the above notation, we have the followings:

1. \( \varphi \) and \( \mathcal{L}^e_\varphi \) are \( \Delta_3 \)-dual to each other.
2. \( \gamma \) and \( \mathcal{L}_\gamma \) are \( \Delta_4 \)-dual to each other.

**Proof.** Consider the mapping \( \mathcal{L}_3(s, u, v) = (\mathcal{L}^e_\varphi(s, u, v), \varphi(s)) \). Then we have

\( \langle \mathcal{L}^e_\varphi(s, u, v), \varphi(s) \rangle = \langle \varphi(s), \varphi(s) \rangle = 1 \)

and

\( \mathcal{L}_3^* \theta_{32} = \langle \mathcal{L}^e_\varphi(s, u, v), \varphi(s) \rangle ds = \langle \mathcal{L}^e_\varphi(s, u, v), t(s) \rangle ds = 0 \).

The assertion (1) holds.

We also consider the mapping \( \mathcal{L}_4(s, u, v) = (\mathcal{L}_\gamma(s, u, v), \gamma(s)) \). Since \( \langle \gamma(s), e_0 \rangle = -1 \) and \( \langle \gamma(s), \varphi(s) \rangle = 1 \), we have \( \langle \mathcal{L}_\gamma(s, u, v), \gamma(s) \rangle = (u^2 + v^2)/4 - 1 - ((u^2 + v^2)/4 + 1) = -2 \). Moreover, we have

\( \mathcal{L}_4^* \theta_{42} = \langle \mathcal{L}_\gamma(s, u, v), \gamma'(s) \rangle ds = \langle \mathcal{L}_\gamma(s, u, v), t(s) \rangle ds = 0 \).
This completes the proof.

We call each one of $\bar{LD}_\gamma^\pm$ the Lightcone dual hypersurface of the de Sitter spherical curve $\gamma$ and $LD_\gamma$ the Lightcone dual hypersurface of the lightlike spherical curve $\gamma$. Then we have two mappings $\pi \circ \bar{LD}_\gamma^\pm : I \times \mathbb{R}^2 \rightarrow S^3_+$ and $\pi \circ LD_\gamma : I \times \mathbb{R}^2 \rightarrow S^3_+$ defined by

\[
\pi \circ \bar{LD}_\gamma^\pm(s, u, v) = \pm \left( \frac{1}{\sqrt{u^2 + v^2 + 1}} \gamma(s) + \frac{u}{\sqrt{u^2 + v^2 + 1}} n(s) + \frac{v}{\sqrt{u^2 + v^2 + 1}} b(s) \right) + e_0, \\
\pi \circ LD_\gamma(s, u, v) = \frac{u^2 + v^2 - 4}{u^2 + v^2 + 4} \gamma(s) + \frac{4u}{u^2 + v^2 + 4} n(s) + \frac{4v}{u^2 + v^2 + 4} b(s) + e_0.
\]

In this paper we consider the singularities of these dual surfaces and mappings. By the Frenet-Serret type formulae, we have

\[
\frac{\partial \bar{LD}_\gamma^\pm}{\partial u}(s, u, v) = n(s) \pm \frac{u}{1 + u^2 + v^2} e_0, \\
\frac{\partial \bar{LD}_\gamma^\pm}{\partial v}(s, u, v) = b(s) \pm \frac{v}{1 + u^2 + v^2} e_0, \\
\frac{\partial \bar{LD}_\gamma^\pm}{\partial s}(s, u, v) = (1 - u\kappa_g(s)) t(s) - v\tau_g(s) n(s) + u\tau_g(s) b(s), \\
\frac{\partial LD_\gamma}{\partial u}(s, u, v) = \frac{u}{2} \gamma(s) + n(s) + \frac{\kappa}{2} e_0, \\
\frac{\partial LD_\gamma}{\partial v}(s, u, v) = \frac{v}{2} \gamma(s) + b(s) + \frac{\kappa}{2} e_0, \\
\frac{\partial LD_\gamma}{\partial s}(s, u, v) = \frac{u^2 + v^2 - 4u\kappa_g(s) - 4}{4} t(s) - v\tau_g(s) n(s) + u\tau_g(s) b(s).
\]

Then we have the following proposition.

**Proposition 4.2.** Let $\gamma : I \rightarrow S^3_+$ be a unit speed curve. Then we have the following:

1. $(s, u, v)$ is a singular point of $\bar{LD}_\gamma^\pm$ if and only if $u = 1/\kappa_g(s)$.
2. $(s, u, v)$ is a singular point of $LD_\gamma$ if and only if $v = \pm \sqrt{4 + 4u\kappa_g(s) - u^2}$.

**Proof.** By the above calculations, $\partial \bar{LD}_\gamma^\pm / \partial u(s, u, v), \partial \bar{LD}_\gamma^\pm / \partial v(s, u, v)$ and $\partial LD_\gamma / \partial s(s, u, v)$ are linearly dependent if and only if $u = 1/\kappa_g(s)$. The assertion (1) follows. By the similar reason, we have the assertion (2).

Therefore, the critical value sets of the above dual surfaces are given by

\[
C(\bar{LD}_\gamma^\pm) = \left\{ \gamma(s) + \frac{1}{\kappa_g(s)} n(s) + v b(s) \pm \sqrt{\frac{1 + \kappa^2_g(s) + v^2 \kappa^2_g(s)}{\kappa^2_g(s)}} e_0 \mid v \in \mathbb{R}, s \in I, \kappa_g(s) \neq 0 \right\},
\]

\[
C(LD_\gamma) = \left\{ \kappa_g(s) u \gamma(s) + u n(s) \pm \sqrt{4 + 4u\kappa_g(s) - u^2} b(s) + (\kappa_g(s) u + 2) e_0 \mid u \in \mathbb{R}, s \in I \right\}.
\]

We respectively denote that

\[
LF_\gamma^\pm(s, v) = \gamma(s) + \frac{1}{\kappa_g(s)} n(s) + v b(s) \pm \sqrt{\frac{1 + \kappa^2_g(s) + v^2 \kappa^2_g(s)}{\kappa^2_g(s)}} e_0, \\
LF_\gamma^\pm(s, u) = \kappa_g(s) u \gamma(s) + u n(s) \pm \sqrt{4 + 4u\kappa_g(s) - u^2} b(s) + (\kappa_g(s) u + 2) e_0.
\]
where we have the relation \( v = \pm \sqrt{4 + 4u\kappa_\gamma(s) - u^2} \). We respectively call each one of \( LF_\gamma^\pm \) the lightcone focal surface of the de Sitter spherical curve \( \overline{\gamma} \) and each one of \( LF_{\gamma'}^\pm \) the lightcone focal surface of the lightcone spherical curve \( \gamma \). Then the projections of these surfaces to \( S^3_+ \) are given as follows:

\[
\pi(C(LD_{\gamma}^\pm)) = \left\{ \pm (\kappa_\gamma(s)\overline{\gamma}(s) + n(s) + v\kappa_\gamma(s)b(s)) + e_0 \mid v \in \mathbb{R}, s \in I, \kappa_\gamma(s) \neq 0 \right\},
\]

\[
\pi(C(LD_{\gamma'}^\pm)) = \left\{ \frac{u\kappa_\gamma(s)\overline{\gamma}(s) + un(s) \pm \sqrt{4 + 4u\kappa_\gamma(s) - u^2b(s)}}{\kappa_\gamma(s)u + 2} + e_0 \mid u \in \mathbb{R}, s \in I \right\}.
\]

On the other hand, we define \( \tilde{\pi} = \Phi \circ \pi : LC^* \to S^3_0 \). By the previous calculations, \( \tilde{\pi}(C(LD_{\gamma}^\pm)) \) is different from \( \tilde{\pi}(C(LD_{\gamma'}^\pm)) \). In [7], it was shown that the projections of the critical value sets of the lightcone dual surfaces of \( \gamma \) and \( \overline{\gamma} \) are the same for a curve \( \gamma : I \to S^2_+ \). Moreover, it is equal to the spherical evolute of \( \overline{\gamma} \). Therefore, the situation for curves in \( S^3_+ \) is quite different from that for curves in \( S^2_+ \).

5 Lightcone height functions

In order to study the singularities of Lightcone dual surfaces of spherical curves, we introduce two families of functions and apply the theory of unfoldings. Let \( \gamma : I \to S^3_+ \) be a unit speed curve, then we define two families of functions as follows:

\[
\overline{\Pi} : I \times LC^* \to \mathbb{R}, \quad \overline{\Pi}(s, v) = \langle \overline{\gamma}(s), v \rangle - 1,
\]

\[
H : I \times LC^* \to \mathbb{R}, \quad H(s, v) = \langle \gamma(s), v \rangle + 2.
\]

We call \( \overline{\Pi} \) a lightcone height function of the de Sitter spherical curve \( \overline{\gamma} \). For any fixed \( v \in LC^* \), we denote \( \overline{h}_v(s) = \overline{\Pi}(s, v) \). We call \( H \) a lightcone height function of the lightlike spherical curve \( \gamma \). For any fixed \( v \in LC^* \), we denote \( h_v(s) = H(s, v) \). Then we have the following two propositions on \( h_v \) and \( \overline{h}_v \).

For simplification, we denote \( \rho(s) = \sqrt{(\kappa_\gamma^2(s)\tau_\gamma^2(s) + \kappa_\gamma^2(s)\tau_\gamma^2(s) + \kappa_\gamma^2(s)\tau_\gamma^2(s))/\kappa_\gamma^2(s)\tau_\gamma^2(s)} \) and \( \sigma_\pm(s) = (\kappa_\gamma^2(s)\tau_\gamma(s) \pm \sqrt{\kappa_\gamma^2(s) + \kappa_\gamma^2(s)\tau_\gamma^2(s) + \kappa_\gamma^2(s)\tau_\gamma^2(s)})/(\kappa_\gamma^2(s) + \kappa_\gamma^2(s)\tau_\gamma^2(s)) \).

**Proposition 5.1.** Let \( \gamma : I \to S^3_+ \) be a unit speed curve, then we have the followings:

1. \( \overline{h}_v(s) = 0 \) if and only if there exist \( \lambda, \mu, \xi, \eta \in \mathbb{R} \) with \( \eta^2 = 1 + \lambda^2 + \mu^2 + \xi^2 \) such that \( v = \overline{\gamma}(s) + \lambda t(s) + \mu n(s) + \xi b(s) + \eta e_0 \).
2. \( \overline{h}_v(s) = \overline{h}'_v(s) = 0 \) if and only if there exist \( \lambda, \mu, \xi, \eta \in \mathbb{R} \) with \( \eta^2 = 1 + \mu^2 + \xi^2 \) such that \( v = \overline{\gamma}(s) + \mu n(s) + \xi b(s) + \eta e_0 = \overline{\gamma}(s) + \mu n(s) + \xi b(s) \pm \sqrt{1 + \mu^2 + \xi^2} e_0 \).
3. \( \overline{h}_v(s) = \overline{h}'_v(s) = \overline{h}''_v(s) = 0 \) if and only if \( \kappa_\gamma(s) \neq 0 \) and \( \rho(s) = \frac{1}{\kappa_\gamma(s)} n(s) + \xi b(s) \pm \sqrt{1 + \kappa_\gamma^2(s) + \kappa_\gamma^2(s)\xi^2}/\kappa_\gamma^2(s) e_0 \).
4. \( \overline{h}_v(s) = \overline{h}'_v(s) = \overline{h}''_v(s) = 0 \) if and only if \( \kappa_\gamma(s) \neq 0, \tau_\gamma(s) \neq 0 \) and \( \rho(s) = \frac{1}{\kappa_\gamma(s)} n(s) - \frac{\kappa_\gamma(s)}{\kappa_\gamma^2(s)\tau_\gamma(s)} b(s) \pm \rho(s) e_0 \).
\[ (5) \quad \bar{h}_v(s) = \bar{h}'_v(s) = \bar{h}''_v(s) = \bar{h}'''_v(s) = \bar{h}''''_v(s) = 0 \text{ if and only if } \kappa_g(s) \neq 0, \tau_g(s) \neq 0, \]
\[
\left( \left( \frac{-1}{\kappa_g(s)} \right) ' + \frac{1}{\tau_g(s)} \right) - \frac{\tau_g(s)}{\kappa_g(s)} = 0
\]
and
\[ v = \gamma(s) + \frac{1}{\kappa_g(s)} n(s) - \frac{\kappa_g''(s)}{\kappa_g(s) \tau_g(s)} b(s) + \rho(s) e_0. \]
\[ (6) \quad \tilde{h}_v(s) = \tilde{h}'_v(s) = \tilde{h}''_v(s) = \tilde{h}'''_v(s) = \tilde{h}''''_v(s) = 0 \text{ if and only if } \kappa_g(s) \neq 0, \tau_g(s) \neq 0, \]
\[
\left( \left( \frac{-1}{\kappa_g(s)} \right) ' + \frac{1}{\tau_g(s)} \right) - \frac{\tau_g(s)}{\kappa_g(s)} = 0
\]
and
\[ v = \gamma(s) + \frac{1}{\kappa_g(s)} n(s) - \frac{\kappa_g''(s)}{\kappa_g(s) \tau_g(s)} b(s) + \rho(s) e_0. \]

**Proof.** (1) Since \( v \in LC^\ast \), there exist \( \omega, \lambda, \mu, \xi, \eta \in \mathbb{R} \) with \( \omega^2 + \lambda^2 + \mu^2 + \xi^2 - \eta^2 = 0 \) such that \( v = \omega \gamma(s) + \lambda t(s) + \mu n(s) + \xi b(s) + \eta e_0 \). From \( \bar{h}_v(s) = \langle \gamma(s), v \rangle - 1 = 0 \), we have \( \omega = 1 \). So \( v = \gamma(s) + \lambda t(s) + \mu n(s) + \xi b(s) + \eta e_0 \) and \( \eta^2 = 1 + \lambda^2 + \mu^2 + \xi^2 \). The converse direction also holds.

(2) Since \( \bar{h}_v(s) = \langle t(s), v \rangle, \bar{h}_v(s) = \bar{h}_v(s) = 0 \text{ if and only if} \]
\[ \bar{h}_v(s) = \langle t(s), v \rangle = \langle t(s), \gamma(s) + \lambda t(s) + \mu n(s) + \xi b(s) + \eta e_0 \rangle = \lambda = 0. \]

It follows from the fact \( \eta^2 = 1 + \mu^2 + \xi^2 \) that \( \eta = \pm \sqrt{1 + \mu^2 + \xi^2} \). Then we have \( v = \gamma(s) + \mu n(s) + \xi b(s) + \eta e_0 = \gamma(s) + \mu n(s) + \xi b(s) \pm \sqrt{1 + \mu^2 + \xi^2} e_0. \)

(3) Since \( \bar{h}_v''(s) = \langle \kappa_g(s) n(s) - \gamma(s), v \rangle, \bar{h}_v(s) = \bar{h}_v'(s) = \bar{h}_v''(s) = 0 \text{ if and only if} \]
\[ \bar{h}_v''(s) = \langle \kappa_g(s) n(s) - \gamma(s), \gamma(s) + \mu n(s) + \xi b(s) \pm \sqrt{1 + \mu^2 + \xi^2} e_0 \rangle = \kappa_g(s) \mu - 1 = 0. \]

Then we have \( \kappa_g(s) \neq 0, \mu = 1/\kappa_g(s) \) and
\[ v = \gamma(s) + n(s)/\kappa_g(s) + \xi b(s) \pm \sqrt{(1 + \kappa^2_g(s) + \kappa^2_g(s) \xi^2)/\kappa^2_g(s)} e_0. \]

(4) Since \( \bar{h}_v'''(s) = \langle \kappa_g(s) n(s) - (\kappa^2_g(s) + 1) t(s) + \kappa_g(s) \tau_g(s) b(s), v \rangle, \bar{h}_v(s) = \bar{h}_v'(s) = \bar{h}_v''(s) = \bar{h}_v'''(s) = 0 \text{ if and only if} \]
\[ \bar{h}_v'''(s) = \langle \kappa_g'(s) n(s) - (\kappa^2_g(s) + 1) t(s) + \kappa_g(s) \tau_g(s) b(s), \gamma(s) + n(s)/\kappa_g(s) + \xi b(s) \pm \sqrt{(1 + \kappa^2_g(s) + \kappa^2_g(s) \xi^2)/\kappa^2_g(s)} e_0 \rangle = \kappa_g'(s)/\kappa_g(s) + \kappa_g(s) \tau_g(s) \xi = 0. \]

Then we have \( \kappa_g(s) \neq 0, \tau_g(s) \neq 0, \xi = -\kappa_g'(s)/\kappa^2_g(s) \tau_g(s) \) and \( v = \gamma(s) + n(s)/\kappa_g(s) - \kappa_g'(s) b(s)/\kappa^2_g(s) \tau_g(s) \pm \rho(s) e_0. \)
(5) Since $\bar{H}''_v(s) = (\kappa''_g(s) - \kappa^2(s))n(s) - 3\kappa_g(s)\kappa'_g(s)\mathbf{t}(s) + (2\kappa'_g(s)\tau_g(s) + \kappa_g(s)\tau'_g(s))b(s) + (1 + \kappa'_g(s))\mathbf{v}$, $\bar{H}_v(s) = \bar{H}'_v(s) = \bar{H}''_v(s) = \bar{H}'''_v(s) = 0$ if and only if

$$\bar{H}''_v(s) = \left\langle \kappa''_g(s) - \kappa^2(s) - \kappa_g(s)\tau'_g(s)\right\rangle n(s) - 3\kappa_g(s)\kappa'_g(s)\mathbf{t}(s)$$

$$+ (2\kappa'_g(s)\tau_g(s) + \kappa_g(s)\tau'_g(s))b(s) + (1 + \kappa'_g(s))\mathbf{v},$$

$$\mathbf{v} = \kappa'_g(s)b(s)/\kappa^2_g(s)\tau_g(s) \pm \rho(s)e_0$$

This is equivalent to the condition $((-1/\kappa_g(s))'/\tau_g(s))' - \tau_g(s)/\kappa_g(s) = 0$. Then we have $\kappa_g(s) \neq 0, \tau_g(s) \neq 0$, $((-1/\kappa_g(s))'/\tau_g(s))' - \tau_g(s)/\kappa_g(s) = 0$ and $\mathbf{v} = \mathbf{v}(s) + n(s)/\kappa_g(s) - \kappa_g(s)b(s)/\kappa^2_g(s)\tau_g(s) \pm \rho(s)e_0$.

(6) Since $\bar{H}''_v(s) = (\kappa''_g(s) + 2\kappa^2(s) + \kappa^2_g(s)\tau'_g(s) + 1 - 3\kappa^2_g(s) - 4\kappa_g(s)\kappa''_g(s))\mathbf{t}(s) + (\kappa''_g(s) - \kappa^2_g(s) - \kappa'_g(s)\tau'_g(s) - 3\kappa_g(s)\tau_g(s))n(s)$

$$+ (3\kappa^2_g(s)\tau_g(s) + 3\kappa'_g(s)\tau'_g(s) + \kappa_g(s)\tau'_g(s) - \kappa_g(s)\tau_g(s) - \kappa_g(s)\tau'_g(s))b(s) + 5\kappa_g(s)\kappa'_g(s)\mathbf{v},$$

$$\mathbf{v} = \kappa'_g(s)b(s)/\kappa^2_g(s)\tau_g(s) \pm \rho(s)e_0$$

This is equivalent to the condition $((-1/\kappa_g(s))'/\tau_g(s))' - \tau_g(s)/\kappa_g(s) = 0$. Then we have $\kappa_g(s) \neq 0, \tau_g(s) \neq 0$, $((-1/\kappa_g(s))'/\tau_g(s))' - \tau_g(s)/\kappa_g(s) = 0$ and $\mathbf{v} = \mathbf{v}(s) + n(s)/\kappa_g(s) - \kappa_g(s)b(s)/\kappa^2_g(s)\tau_g(s) \pm \rho(s)e_0$. This completes the proof.

Proposition 5.2. Let $\gamma : I \rightarrow S^3_+$ be a unit speed curve, then we have the followings:

1. $h_v(s) = 0$ if and only if $\mathbf{v} = \lambda\mathbf{v}(s) + \mu\mathbf{t}(s) + \xi\mathbf{n}(s) + \eta\mathbf{b}(s) + (\lambda + 2)e_0$, where $\lambda, \mu, \xi, \eta \in \mathbb{R}$ and $\mu^2 + \xi^2 + \eta^2 - 4\lambda - 4 = 0$.

2. $h_v(s) = h'_v(s) = 0$ if and only if $\mathbf{v} = ((\xi^2 + \eta^2)/4 - 1)\mathbf{v}(s) + \xi\mathbf{n} + \eta\mathbf{b} + ((\xi^2 + \eta^2)/4 + 1)e_0$.

3. $h_v(s) = h'_v(s) = h''_v(s) = 0$ if and only if

$$\mathbf{v} = \kappa_g(s)\xi\mathbf{v}(s) + \xi\mathbf{n}(s) \pm \sqrt{4 + 4\kappa_g(s)\xi - \xi^2}\mathbf{b}(s) + (\kappa_g(s)\xi + 2)e_0.$$
(4) \( h_v(s) = h'_v(s) = h''_v(s) = h'''_v(s) = 0 \) if and only if \( \kappa^2_g(s) + \kappa^2_g(s) \tau^2_g(s) \neq 0 \) and
\[
\mathbf{v} = 2 \kappa^2_g(s) \tau_g(s) \sigma^\pm(s) \mathbf{\gamma}(s) + 2 \kappa^2_g(s) \tau_g(s) \sigma^\pm(s) \mathbf{n}(s) - 2 \kappa^2_g(s) \sigma^\pm(s) \mathbf{b}(s) + (2 \kappa^2_g(s) \tau_g(s) \sigma^\pm(s) + 2) \mathbf{e}_0.
\]
(5) \( h_v(s) = h'_v(s) = h''_v(s) = h'''_v(s) = 0 \) if and only if \( \kappa^2_g(s) + \kappa^2_g(s) \tau^2_g(s) \neq 0 \),
\[
\left( \left( \frac{-1}{\kappa_g(s)} \right)' \frac{1}{\tau_g(s)} \right)' - \frac{\tau_g(s)}{\kappa_g(s)} = 0
\]
and
\[
\mathbf{v} = 2 \kappa^2_g(s) \tau_g(s) \sigma^\pm(s) \mathbf{\gamma}(s) + 2 \kappa^2_g(s) \tau_g(s) \sigma^\pm(s) \mathbf{n}(s) - 2 \kappa^2_g(s) \sigma^\pm(s) \mathbf{b}(s) + (2 \kappa^2_g(s) \tau_g(s) \sigma^\pm(s) + 2) \mathbf{e}_0.
\]
(6) \( h_v(s) = h'_v(s) = h''_v(s) = h'''_v(s) = h''''_v(s) = 0 \) if and only if \( \kappa^2_g(s) + \kappa^2_g(s) \tau^2_g(s) \neq 0 \),
\[
\left( \left( \frac{-1}{\kappa_g(s)} \right)' \frac{1}{\tau_g(s)} \right)' - \frac{\tau_g(s)}{\kappa_g(s)} = 0
\]
and
\[
\mathbf{v} = 2 \kappa^2_g(s) \tau_g(s) \sigma^\pm(s) \mathbf{\gamma}(s) + 2 \kappa^2_g(s) \tau_g(s) \sigma^\pm(s) \mathbf{n}(s) - 2 \kappa^2_g(s) \sigma^\pm(s) \mathbf{b}(s) + (2 \kappa^2_g(s) \tau_g(s) \sigma^\pm(s) + 2) \mathbf{e}_0.
\]
Proof. (1) Since \( \mathbf{v} \in LC^\ast \), there exist \( \lambda, \mu, \xi, \eta, \omega \in \mathbb{R} \) with \( \lambda^2 + \mu^2 + \xi^2 + \eta^2 - \omega^2 = 0 \) such that \( \mathbf{v} = \lambda \mathbf{\gamma}(s) + \mu \mathbf{t}(s) + \xi \mathbf{n}(s) + \eta \mathbf{b}(s) + \omega \mathbf{e}_0 \). From \( h_v(s) = \langle \mathbf{\gamma}(s), \mathbf{v} \rangle + 2 = \langle \mathbf{\gamma}(s) + \mathbf{e}_0, \lambda \mathbf{\gamma}(s) + \mu \mathbf{t}(s) + \xi \mathbf{n}(s) + \eta \mathbf{b}(s) + \omega \mathbf{e}_0 \rangle + 2 = \lambda - \omega + 2 = 0 \), we have \( \omega = 2 \lambda \). So \( \mathbf{v} = \lambda \mathbf{\gamma}(s) + \mu \mathbf{t}(s) + \xi \mathbf{n}(s) + \eta \mathbf{b}(s) + (2 + \lambda) \mathbf{e}_0 \) and \( \lambda^2 + \mu^2 + \xi^2 + \eta^2 - (2 + \lambda)^2 \) is impossible. The converse direction also holds.

(2) Since \( h'_v(s) = \langle \mathbf{t}(s), \mathbf{v} \rangle \), \( h_v(s) = h'_v(s) = 0 \) if and only if
\[
h'_v(s) = \langle \mathbf{t}(s), \lambda \mathbf{\gamma}(s) + \mu \mathbf{t}(s) + \xi \mathbf{n}(s) + \eta \mathbf{b}(s) + (2 + \lambda) \mathbf{e}_0 \rangle = \mu = 0.
\]
By \( \lambda^2 + \xi^2 + \eta^2 - (2 + \lambda)^2 = \xi^2 + \eta^2 - 4 \lambda - 4 = 0 \), we have \( \lambda = (\xi^2 + \eta^2)/4 - 1 \). So,
\[
\mathbf{v} = ((\xi^2 + \eta^2)/4 - 1) \mathbf{\gamma}(s) + \xi \mathbf{n}(s) + \eta \mathbf{b}(s) + ((\xi^2 + \eta^2)/4 + 1) \mathbf{e}_0.
\]
(3) Since \( h''_v(s) = \langle \kappa_g(s) \mathbf{n}(s) - \mathbf{\gamma}(s), \mathbf{v} \rangle \), \( h_v(s) = h'_v(s) = h''_v(s) = 0 \) if and only if
\[
h''_v(s) = \langle \kappa_g(s) \mathbf{n}(s) - \mathbf{\gamma}(s), \left( \frac{\xi^2 + \eta^2}{4} - 1 \right) \mathbf{\gamma}(s) + \xi \mathbf{n}(s) + \eta \mathbf{b}(s) + \left( \frac{\xi^2 + \eta^2}{4} + 1 \right) \mathbf{e}_0 \rangle
\]
\[
= (4 \kappa_g(s) \xi - \xi^2 - \eta^2 + 4)/4 = 0,
\]
so that we have \( \eta = \pm \sqrt{4 + 4 \kappa_g(s) \xi} - \xi^2 \) and \( \mathbf{v} = \kappa_g(s) \xi \mathbf{\gamma}(s) + \xi \mathbf{n}(s) \pm \sqrt{4 + 4 \kappa_g(s) \xi - \xi^2} \mathbf{b}(s) + (\kappa_g(s) \xi + 2) \mathbf{e}_0 \).

(4) Since \( h'''_v(s) = \langle \kappa'_g(s) \mathbf{n}(s) - (\kappa^2_g(s) + 1) \mathbf{t}(s) + \kappa_g(s) \tau_g(s) \mathbf{b}(s), \mathbf{v} \rangle \), \( h_v(s) = h'_v(s) = h''_v(s) = h'''_v(s) = 0 \) if and only if
\[
h'''_v(s) = \langle \kappa'_g(s) \mathbf{n}(s) - (\kappa^2_g(s) + 1) \mathbf{t}(s) + \kappa_g(s) \tau_g(s) \mathbf{b}(s), \kappa_g(s) \xi \mathbf{\gamma}(s) + \xi \mathbf{n}(s) \pm \sqrt{4 + 4 \kappa_g(s) \xi - \xi^2} \mathbf{b}(s) + (\kappa_g(s) \xi + 2) \mathbf{e}_0 \rangle
\]
\[
= \kappa'_g(s) \xi + \kappa_g(s) \tau_g(s) \eta = \kappa'_g(s) \xi \pm \kappa_g(s) \tau_g(s) \sqrt{4 + 4 \kappa_g(s) \xi - \xi^2} = 0,
\]
Proof. By the above condition, we have the equation $(\kappa''_g(s) \neq 0, \xi = 2\kappa_g(s)\tau_g(s)\sigma^+(s)$ and $v = 2\kappa^2_g(s)\tau_g(s)\sigma^+(s)\overrightarrow{\gamma}(s) + 2\kappa_g(s)\tau_g(s)\sigma^+(s)\mathbf{n}(s) - 2\kappa'_g(s)\sigma^+(s)\mathbf{b}(s) + (2\kappa'_g(s)\tau_g(s)\sigma^+(s) + 2)\mathbf{e}_0$.

(5) Since $h^{(4)}_0(s) = 0$, then we have $(\kappa''_g(s) - \kappa_g(s)\tau_g^2(s))\mathbf{n}(s) - 2\kappa_g(s)\kappa'_g(s)\mathbf{t}(s)$

(6) Since $h^{(5)}_0(s) = 0$, then we have $(\kappa''_g(s) - \kappa_g(s)\tau_g^2(s))\mathbf{n}(s) - 2\kappa_g(s)\kappa'_g(s)\mathbf{t}(s)$

By the above condition, we have the equation $(\kappa''_g(s) - \kappa_g(s)\tau_g^2(s))\mathbf{n}(s) - 2\kappa_g(s)\kappa'_g(s)\mathbf{t}(s)$
On the other hand $\kappa_S(s) = ((-1/\kappa_g(s))'\tau_g(s))' - \tau_g(s)/\kappa_g(s) = (\kappa_g(s)\kappa_g'(s)\tau_g(s) - 2\kappa_g^2(s)\tau_g(s) - \kappa_g(s)\kappa_g'(s)\tau_g'(s) - \kappa_g^2(s)\tau_g^2(s))/\kappa_g^3(s)\tau_g^2(s) = 0$. So $e_{\gamma+}^\pm \equiv 0$ if and only if $\kappa_S \equiv 0$. This completes the proof.

6 Singularities of lightcone duals of spherical curves

In this section we classify the singularities of $\overline{LD}_\gamma^{\pm}$ and $LD_\gamma$ as an application of the unfolding theory of functions. Let $F : (\mathbb{R} \times \mathbb{R}_+, (s_0, x_0)) \to \mathbb{R}$ be a function germ, we call $F$ an $r$-parameter unfolding of $f$, where $f(s) = F_{x_0}(s, x_0)$. The discriminant set of $F$ is defined by

$$D_F = \left\{ x \in \mathbb{R}^r \mid \exists s \in \mathbb{R}, \ F(s, x) = \frac{\partial F}{\partial s}(s, x) = 0 \right\}.$$  

By Propositions 5.1, (2) and 5.2, (2), the discriminant set of $H$ and $\overline{H}$ are

$$D_{\overline{H}} = \{(\tau_g(s) + u(n(s) + v(b(s) + \sqrt{u^2 + v^2 + 1}e_0) \mid s \in I, u, v \in \mathbb{R}\},$$

$$D_H = \{((u^2 + v^2 - 4)\tau_g(s)/4 + u(n(s) + v(b(s) + (u^2 + v^2 + 4)}e_0)/4 \mid s \in I, u, v \in \mathbb{R}\}.$$  

These are the lightcone dual surfaces of $\overline{\gamma}$ and the lightcone dual surface of $\gamma$ respectively. Moreover, the both assertions (4) of Propositions 5.1 and 5.2 describe the singularities of the lightcone focal surfaces of $\gamma$ and $\overline{\gamma}$ respectively.

**Proposition 6.1.** The critical value sets of $LF_{\overline{\gamma}}^{\pm}$ and $LF_{\gamma}^{\pm}$ are given as follows:

$$C(LF_{\overline{\gamma}}^{\pm}) = \left\{ \overline{\gamma}(s) + \frac{1}{\kappa_g(s)}n(s) - \frac{\kappa_g'(s)}{\kappa_g^3(s)}b(s) \pm \rho(s)e_0 \mid s \in I \right\},$$

$$C(LF_{\gamma}^{\pm}) = \{2\kappa_g^2(s)\tau_g(s)\sigma^\pm(s)\overline{\gamma}(s) + 2\kappa_g(s)\tau_g(s)\sigma^\pm(s)n(s) - 2\kappa_g'(s)\sigma^\pm(s)b(s) + (2\kappa_g^2(s)\tau_g(s))\sigma^\pm(s) + 2)e_0 \mid s \in I \}.$$  

Then we have the following theorem as a corollary.

**Theorem 6.2.** Both of the projections of the critical value sets $C(LF_{\overline{\gamma}}^{\pm})$ and $C(LF_{\gamma}^{\pm})$ in the unit 3-sphere $S_3^3$ are the images of the spherical evolutes of $\overline{\gamma}$, that is

$$\overline{\pi}(C(LF_{\overline{\gamma}}^{\pm})) = \overline{\pi}(C(LF_{\gamma}^{\pm})) = \{e_{\gamma+}^\pm(s) \mid s \in I \}.$$  

**Proof.** We know that

$$\overline{\pi}(C(LF_{\overline{\gamma}}^{\pm})) = \left\{ \pm \left( \frac{\overline{\gamma}(s)}{\rho(s)} + \frac{n(s)}{\rho(s)\kappa_g(s)} - \frac{\kappa_g'(s)b(s)}{\rho(s)\kappa_g^3(s)\tau_g(s)} \right) \mid s \in I \right\}$$

and

$$\overline{\pi}(C(LF_{\gamma}^{\pm})) = \left\{ \frac{\kappa_g^2(s)\tau_g(s)\sigma^\pm(s)\overline{\gamma}(s) + \kappa_g(s)\tau_g(s)\sigma^\pm(s)n(s) - \kappa_g'(s)\sigma^\pm(s)b(s)}{\kappa_g^2(s)\tau_g(s)\sigma^\pm(s) + 1} \right\} \mid s \in I \}.$$  

13
By straightforward calculations, we have
\[
\frac{r^2_g(s)\tau_g(s)\sigma^\pm(s)}{r^2_g(s)\tau_g(s)\sigma^\pm(s) + 1} = \frac{\kappa^2_g(s)\tau_g(s)(\kappa^2_g(s)\tau_g(s) + \sqrt{\kappa^2_g(s) + \kappa^2_g(s)\tau_g^2(s) + \kappa^4_g(s)\tau_g^2(s)})}{\kappa^2_g(s) + \kappa^2_g(s)\tau_g^2(s) + \kappa^4_g(s)\tau_g^2(s) + \kappa^2_g(s)\tau_g^2(s) + \kappa^4_g(s)\tau_g^2(s)}
\]

Similarly, we can calculate that
\[
\frac{\kappa_g(s)\tau_g(s)\sigma^\pm(s)}{\kappa^2_g(s)\tau_g(s)\sigma^\pm(s) + 1} = \frac{\pm\kappa^2_g(s)\tau_g(s)}{\pm\kappa^2_g(s)\tau_g(s) + \kappa^2_g(s)\tau_g(s) + \kappa^4_g(s)\tau_g^2(s)} = \frac{\pm1}{\rho(s)}.
\]

So we have
\[
\tilde{\pi}(C(LF^\pm_{\gamma})) = \tilde{\pi}(C(LF^\pm_{\gamma})) = \{e^\pm_\gamma(s) \mid s \in I \}.
\]

This completes the proof.

As Propositions 5.1, 5.2 and Theorem 6.2, we define the following set:
\[
D^\ell_F = \left\{ x \in \mathbb{R}^r \mid \exists s \in \mathbb{R}, \ F(s, x) = \frac{\partial F}{\partial s}(s, x) = \cdots = \frac{\partial^F}{\partial s^F}(s, x) = 0 \right\},
\]

which is called a discriminant set of order \( \ell \). Of course, \( D^1_F = D_F \). In order to understand the geometric properties of the discriminant set of order \( \ell \), we introduce an equivalence relation among the unfoldings of functions. Let \( F \) and \( G \) be \( \ell \)-parameter unfoldings of \( f(s) \) and \( g(s) \), respectively. We say that \( F \) and \( G \) are \( P-R \)-equivalent if there exists a diffeomorphism germ \( \Phi : (\mathbb{R} \times \mathbb{R}^r, (s_0, x_0)) \rightarrow (\mathbb{R} \times \mathbb{R}^r, (s'_0, x'_0)) \) of the form \( \Phi(s, x) = (\Phi_1(s, x), \phi(x)) \) such that \( G \circ \Phi = F \). By straightforward calculations, we have the following proposition.

**Proposition 6.3.** Let \( F \) and \( G \) be \( \ell \)-parameter unfoldings of \( f(s) \) and \( g(s) \), respectively. If \( F \) and \( G \) are \( P-R \)-equivalent by a diffeomorphism germ \( \Phi : (\mathbb{R} \times \mathbb{R}^r, (s_0, x_0)) \rightarrow (\mathbb{R} \times \mathbb{R}^r, (s'_0, x'_0)) \) of the form \( \Phi(s, x) = (\Phi_1(s, x), \phi(x)) \), then \( \phi(D^\ell_F) = D^\ell_G \) as set germs.

By Propositions 5.1 and 5.2, we have the following proposition.

**Proposition 6.4.** Under the same notations as in the previous paragraphs, we have
\[
D^1_H = D^1_H = \text{Image } LD_{\tau}^{\pm}, \quad D^2_H = \text{Image } LF_{\gamma}^{\pm}, \quad \tilde{\pi}(D^2_H) = \text{Image } \varepsilon^\pm_\gamma,
\]
\[
D^1_H = D^1_H = \text{Image } LD_{\gamma}, \quad D^2_H = \text{Image } LF_{\gamma}^{\pm}, \quad \tilde{\pi}(D^2_H) = \text{Image } \varepsilon^\pm_\gamma.
\]

For a function \( f(s) \), we say that \( f \) has \( A_k \)-singularity at \( s_0 \) if \( f^{(p)}(s_0) = 0 \) for all \( 1 \leq p \leq k \) and \( f^{(k+1)}(s_0) \neq 0 \). Let \( F \) be an \( \ell \)-parameter unfolding of \( f \) and \( f \) has \( A_k \)-singularity \( (k \geq 1) \) at \( s_0 \). We denote the \( (k - 1) \)-jet of the partial derivative \( \partial F/\partial x_i \) at \( s_0 \) as
\[
j^{(k-1)}\left( \frac{\partial F}{\partial x_i}(s, x_0) \right)(s_0) = \sum_{j=1}^{k-1} \alpha_{ji}(s - s_0)^j, \quad (i = 1, \cdots, r).
\]
If the rank of $k \times r$ matrix $(\alpha_{0i}, \alpha_{ji})$ is $k$ ($k \leq r$), then $F$ is called a \textit{versal unfolding} of $f$, where $\alpha_{0i} = \partial F/\partial x_i(s_0, x_0)$. We have the following classification theorem of versal unfoldings \cite[Page 149, 6.6]{3}.

**Theorem 6.5.** Let $F : (\mathbb{R} \times \mathbb{R}^r, (s_0, x_0)) \rightarrow \mathbb{R}$ be an $r$-parameter unfolding of $f$ which has $A_k$-singularity at $s_0$. Suppose $F$ is a versal unfolding of $f$, then $F$ is $P$-$R$-equivalent to one of the following unfoldings:

(a) $k = 1 ; \pm s^2 + x_1,$  
(b) $k = 2 ; s^3 + x_1 + sx_2,$  
(c) $k = 3 ; \pm s^4 + x_1 + sx_2 + s^2x_3,$  
(d) $k = 4 ; s^5 + x_1 + sx_2 + s^2x_3 + s^3x_4.$  

We have the following classification result as a corollary of the above theorem.

**Corollary 6.6.** Let $F : (\mathbb{R} \times \mathbb{R}^r, (s_0, x_0)) \rightarrow \mathbb{R}$ be an $r$-parameter unfolding of $f$ which has $A_k$-singularity at $s_0$. Suppose $F$ is a versal unfolding of $f$, then we have the following assertions:

(a) If $k = 1,$ then $D_F$ is diffeomorphic to $\{0\} \times \mathbb{R}^{r-1}$ and $D^3_F = \emptyset.$  
(b) If $k = 2,$ then $D_F$ is diffeomorphic to $C(2,3) \times \mathbb{R}^{r-2}, D^2_F$ is diffeomorphic to $\{0\} \times \mathbb{R}^{r-2}$ and $D^3_F = \emptyset.$  
(c) If $k = 3,$ then $D_F$ is diffeomorphic to $SW \times \mathbb{R}^{r-3}, D^2_F$ is diffeomorphic to $C(2,3,4) \times \mathbb{R}^{r-3}, D^3_F$ is diffeomorphic to $\{0\} \times \mathbb{R}^{r-3}$ and $D^3_F = \emptyset.$  
(d) If $k = 4,$ then $D_F$ is locally diffeomorphic to $BF \times \mathbb{R}^{r-4}, D^2_F$ is diffeomorphic to $C(BF) \times \mathbb{R}^{r-4}, D^3_F$ is diffeomorphic to $\{0\} \times \mathbb{R}^{r-4}$ and $D^3_F = \emptyset.$

We remark that all of diffeomorphisms in the above assertions are diffeomorphism germs.

Here, we respectively call $C(2,3) = \{(x_1, x_2) \mid x_1 = u^2, x_2 = u^3\}$ a $(2,3)$-cusp, $C(2,3,4) = \{(x_1, x_2, x_3) \mid x_1 = u^2, x_2 = u^3, x_3 = u^4\}$ a $(2,3,4)$-cusp, $C(2,3,4,5) = \{(x_1, x_2, x_3, x_4) \mid x_1 = u^2, x_2 = u^3, x_3 = u^4, x_4 = u^5\}$ a $(2,3,4,5)$-cusp, $SW = \{(x_1, x_2, x_3) \mid x_1 = 3u^4 + u^2v, x_2 = 4u^3 + 2uv, x_3 = v\}$ a swallow tail, $BF = \{(x_1, x_2, x_3, x_4) \mid x_1 = v^4 + 3uv^2 + 2uv, x_2 = 4u^5 + 2uv^3 + uv^2, x_3 = 3u, x_4 = v\}$ a butterfly and $C(BF) = \{(x_1, x_2, x_3, x_4) \mid x_1 = 6u^3 + u^2v, x_2 = 25u^2 + 9uv^2, x_3 = 10u^2 + 3uv, x_4 = v\}$ a $c$-butterfly (i.e., the critical value set of the butterfly).

We have the following key propositions in $H$ and $\overline{H}$.

**Proposition 6.7.** If $\overline{H}_{e_0}$ has $A_k$-singularity ($k = 1, 2, 3, 4$) at $s_0$, then $\overline{H}$ is a versal unfolding of $\overline{H}_{e_0}$.

**Proof.** For $\mathbf{v} \in LC^r$, we have $\mathbf{v} = (\pm(v_1^2 + v_2^2 + v_3^2 + v_4^2)^{1/2}, v_1, v_2, v_3, v_4)$. We denote that $\overline{\gamma}(s) = (0, x_1(s), x_2(s), x_3(s), x_4(s))$. Then

$$\overline{H}(s, \mathbf{v}) = \langle \overline{\gamma}(s), \mathbf{v} \rangle - 1 = x_1(s)v_1 + x_2(s)v_2 + x_3(s)v_3 + x_4(s)v_4 - 1.$$  

Thus we have

$$\frac{\partial \overline{H}}{\partial v_1}(s, \mathbf{v}) = x_1(s), \quad \frac{\partial \overline{H}}{\partial v_2}(s, \mathbf{v}) = x_2(s), \quad \frac{\partial \overline{H}}{\partial v_3}(s, \mathbf{v}) = x_3(s), \quad \frac{\partial \overline{H}}{\partial v_4}(s, \mathbf{v}) = x_4(s),$$  

$$\frac{\partial^2 \overline{H}}{\partial s \partial v_1}(s, \mathbf{v}) = x_1'(s), \quad \frac{\partial^2 \overline{H}}{\partial s \partial v_2}(s, \mathbf{v}) = x_2'(s), \quad \frac{\partial^2 \overline{H}}{\partial s \partial v_3}(s, \mathbf{v}) = x_3'(s), \quad \frac{\partial^2 \overline{H}}{\partial s \partial v_4}(s, \mathbf{v}) = x_4'(s).$$
\[
\frac{\partial^3 H}{\partial s^2 \partial v_1}(s, v) = x''_1(s), \quad \frac{\partial^3 H}{\partial s^2 \partial v_2}(s, v) = x''_2(s), \quad \frac{\partial^3 H}{\partial s^2 \partial v_3}(s, v) = x''_3(s), \quad \frac{\partial^3 H}{\partial s^2 \partial v_4}(s, v) = x''_4(s),
\]
\[
\frac{\partial^3 H}{\partial s^3 \partial v_1}(s, v) = x'''_1(s), \quad \frac{\partial^3 H}{\partial s^3 \partial v_2}(s, v) = x'''_2(s), \quad \frac{\partial^3 H}{\partial s^3 \partial v_3}(s, v) = x'''_3(s), \quad \frac{\partial^3 H}{\partial s^3 \partial v_4}(s, v) = x'''_4(s).
\]

For a fixed point \(v_0 = (v_{00}, v_{01}, v_{02}, v_{03}, v_{04})\), the 3-jet of \(\partial H / \partial v_i(s, v_0)(i = 1, 2, 3, 4)\) at \(s_0\) is
\[
j^{(3)} \frac{\partial H}{\partial v_i}(s, v_0)(s_0) = x'_i(s_0)(s - s_0) + x''_i(s_0)(s - s_0)^2/2 + x'''_i(s_0)(s - s_0)^3/6, \quad (i = 1, 2, 3, 4).
\]

It is enough to show that the rank of the matrix \(A\) is 4, where
\[
A = \begin{pmatrix}
x_1(s_0) & x_2(s_0) & x_3(s_0) & x_4(s_0) \\
x'_1(s_0) & x'_2(s_0) & x'_3(s_0) & x'_4(s_0) \\
x''_1(s_0) & x''_2(s_0) & x''_3(s_0) & x''_4(s_0) \\
x'''_1(s_0) & x'''_2(s_0) & x'''_3(s_0) & x'''_4(s_0)
\end{pmatrix}.
\]

Then we have
\[
\det A = (e_0 \wedge \gamma(s_0) \wedge \gamma'(s_0) \wedge \gamma''(s_0), \gamma'''(s_0)) = -\kappa'_2(s_0)\tau_2(s_0) \neq 0.
\]
So the rank of \(A\) is 4, this completes the proof.

**Proposition 6.8.** If \(h_{v_0}\) has \(A_k\)-singularity \((k = 1, 2, 3, 4)\) at \(s_0\), then \(H\) is a versal unfolding of \(h_{v_0}\).

**Proof.** For \(v \in LC^*\), we have \(v = (v_0, v_1, v_2, v_3, v_4) = (\pm(v_1^2 + v_2^2 + v_3^2 + v_4^2)^{1/2}, v_1, v_2, v_3, v_4)\). We denote that \(\gamma(s) = (1, x_1(s), x_2(s), x_3(s)x_4(s))\). Then we have
\[
H(s, v) = \langle \gamma(s), v \rangle + 2 + \mp(v_1^2 + v_2^2 + v_3^2 + v_4^2)^{1/2} + x_1(s)v_1 + x_2(s)v_2 + x_3(s)v_3 + x_4(s)v_4 + 2.
\]

Thus we have
\[
\frac{\partial H}{\partial v_1}(s, v) = -v_1/v_0 + x_1(s), \quad \frac{\partial H}{\partial v_2}(s, v) = -v_2/v_0 + x_2(s),
\]
\[
\frac{\partial^2 H}{\partial v_1^2}(s, v) = x'_1(s), \quad \frac{\partial^2 H}{\partial v_1 \partial v_2}(s, v) = x'_2(s), \quad \frac{\partial^2 H}{\partial v_1 \partial v_3}(s, v) = x'_3(s), \quad \frac{\partial^2 H}{\partial v_1 \partial v_4}(s, v) = x'_4(s),
\]
\[
\frac{\partial^3 H}{\partial s^2 \partial v_1}(s, v) = x''_1(s), \quad \frac{\partial^3 H}{\partial s^2 \partial v_2}(s, v) = x''_2(s), \quad \frac{\partial^3 H}{\partial s^2 \partial v_3}(s, v) = x''_3(s), \quad \frac{\partial^3 H}{\partial s^2 \partial v_4}(s, v) = x''_4(s),
\]
\[
\frac{\partial^4 H}{\partial s^3 \partial v_1}(s, v) = x'''_1(s), \quad \frac{\partial^4 H}{\partial s^3 \partial v_2}(s, v) = x'''_2(s), \quad \frac{\partial^4 H}{\partial s^3 \partial v_3}(s, v) = x'''_3(s), \quad \frac{\partial^4 H}{\partial s^3 \partial v_4}(s, v) = x'''_4(s).
\]

For a fixed \(v_0 = (v_{00}, v_{01}, v_{02}, v_{03}, v_{04})\), the 3-jet of \(\partial H / \partial v_i(s, v_0)(i = 1, 2, 3, 4)\) at \(s_0\) is
\[
j^{(3)} \frac{\partial H}{\partial v_i}(s, v_0)(s_0) = x'_i(s_0)(s - s_0) + x''_i(s_0)(s - s_0)^2/2 + x'''_i(s_0)(s - s_0)^3/6, \quad (i = 1, 2, 3, 4).
\]
It is enough to show that the rank of the matrix \( B \) is three, where
\[
B = \begin{pmatrix}
-v_{01}/v_{00} + x_1(s_0) & -v_{02}/v_{00} + x_2(s_0) & -v_{03}/v_{00} + x_3(s_0) & -v_{04}/v_{00} + x_4(s_0) \\
x_1'(s_0) & x_2'(s_0) & x_3'(s_0) & x_4'(s_0) \\
x_1''(s_0) & x_2''(s_0) & x_3''(s_0) & x_4''(s_0)
\end{pmatrix}.
\]
By straightforward calculations, we have
\[
\det B = \left\langle e_0 \wedge \gamma'(s_0) \wedge \gamma''(s_0), v_0 \right\rangle / v_{00} + \left\langle e_0 \wedge \gamma'(s_0) \wedge \gamma''(s_0), \gamma'''(s_0) \right\rangle
= (\kappa_g^2(s_0) \tau_g(s_0) \gamma(s_0), v_0) / v_{00} - (\kappa_g'(s_0) b(s_0), v_0) / v_{00} + (\kappa_g(s_0) \tau_g(s_0) n(s_0), v_0) / v_{00} - \kappa_g^2(s_0) \tau_g(s_0).
\]
In this case, \( h_{v_0}(s) \) has \( A_4 \)-singularity, then we have
\[
v_0 = 2\kappa_g^2(s_0) \tau_g(s_0) \sigma^+(s_0) \gamma(s_0) + 2\kappa_g(s_0) \tau_g(s_0) \sigma^+(s_0) n(s_0) - 2\kappa_g'(s_0) \sigma^+(s_0) b(s_0)
+ (2\kappa_g^2(s_0) \tau_g(s_0) \sigma^+(s_0) + 2)e_0.
\]
Moreover we have
\[
v_{00} = 2\kappa_g^2(s_0) \tau_g(s_0) \sigma^+(s_0) + 2.
\]
Therefore by calculation, we have
\[
\det B = \pm \frac{\kappa_g^2(s_0) \tau_g^2(s_0) + \kappa_g'^2(s_0)}{\sqrt{\kappa_g^2(s_0) + \kappa_g'^2(s_0) \tau_g^2(s_0) + \kappa_g^2(s_0) \tau_g^2(s_0) \kappa_g^2(s_0) \tau_g(s_0) \kappa_g^2(s_0) \tau_g(s_0)}}
\neq 0.
\]
So the rank of \( B \) is 4. This completes the proof.

We have the following theorem:

**Theorem 6.9.** Let \( \gamma : I \to S^3_+ \) be a unit speed curve.

(A) For each one of the lightcone duals \( \mathcal{L}_f^+_{\gamma} \) of \( \gamma \), we have the following assertions:

1. Each one of the lightcone duals \( \mathcal{L}_f^+_{\gamma} \) of \( \gamma \) is locally diffeomorphic to \( C(2, 3) \times \mathbb{R}^2 \) at \((s_0, u_0, v_0)\) if and only if
   \[
   \kappa_g(s_0) \neq 0, \ u_0 = \frac{1}{\kappa_g(s_0)} \quad \text{and} \quad v_0 = \left( \frac{1}{\kappa_g(s_0)} \right)' \frac{1}{\tau_g(s_0)}.
   \]
   In this case, each one of \( LF^\pm_{\gamma} \) is non-singular and each one of Images \( \mathcal{E}^\pm_{\gamma} \) is empty.

2. Each one of the lightcone duals \( \mathcal{L}_f^+_{\gamma} \) of \( \gamma \) is locally diffeomorphic to \( SW \times \mathbb{R} \) at \((s_0, u_0, v_0)\) if and only if
   \[
   \kappa_g(s_0) \neq 0, \ \tau_g(s_0) \neq 0, \ u_0 = \frac{1}{\kappa_g(s_0)}, \ v_0 = \left( \frac{1}{\kappa_g(s_0)} \right)' \frac{1}{\tau_g(s_0)} \quad \text{and} \quad \kappa_S(s_0) \neq 0.
   \]
   In this case, each one of \( LF^\pm_{\gamma} \) is locally diffeomorphic to \( C(2, 3, 4) \times \mathbb{R} \) and each one of Images \( \mathcal{E}^\pm_{\gamma} \) is a regular curve.

3. Each one of the lightcone duals \( \mathcal{L}_f^+_{\gamma} \) of \( \gamma \) is locally diffeomorphic to \( BF \) at \((s_0, u_0, v_0)\) if and only if
   \[
   \kappa_g(s_0) \neq 0, \ \tau_g(s_0) \neq 0, \ u_0 = \frac{1}{\kappa_g(s_0)} \quad \text{and} \quad v_0 = \left( \frac{1}{\kappa_g(s_0)} \right)' \frac{1}{\tau_g(s_0)}, \ \kappa_S(s_0) = 0 \quad \text{and} \quad \kappa_S'(s_0) \neq 0.
   \]

17
In this case, each one of $LF^±_\gamma$ is locally diffeomorphic to $C(BF) \times \mathbb{R}$ and each one of Images $\varepsilon^±_\gamma$ is locally diffeomorphic to the projection of the $C(2, 3, 4, 5)$-cusp.

(B) For the lightcone dual $LD_\gamma$ of $\gamma$, we have the following assertions:

1. The lightcone dual $LD_\gamma$ of $\gamma$ is locally diffeomorphic to $C(2, 3) \times \mathbb{R}^2$ at $(s_0, u_0, v_0)$ if and only if
   \[ u_0 \neq 2\kappa_g(s_0)\tau_g(s_0)\sigma^±(s_0) \text{ and } v_0 = \pm \sqrt{4 + 4\kappa_g(s_0)u_0 - u_0^2}. \]
   In this case, each one of $LF^±_\gamma$ is non-singular and each one of Images $\varepsilon^±_\gamma$ is empty.

2. The lightcone dual $LD_\gamma$ of $\gamma$ is locally diffeomorphic to $SW \times \mathbb{R}$ at $(s_0, u_0, v_0)$ if and only if
   \[ \kappa_g^2(s_0) + \kappa_g^2(s_0)\tau_g^2(s_0) \neq 0, \quad u_0 = 2\kappa_g(s_0)\tau_g(s_0)\sigma^±(s_0), \quad v_0 = -2\kappa'_g(s_0)\sigma^±(s_0) \text{ and } \kappa_S(s_0) \neq 0. \]
   In this case, each one of $LF^±_\gamma$ is locally diffeomorphic to $C(2, 3, 4) \times \mathbb{R}$ and each one of Images $\varepsilon^±_\gamma$ is a regular curve.

3. The lightcone dual $LD_\gamma$ of $\gamma$ is locally diffeomorphic to $BF$ at $(s_0, u_0, v_0)$ if and only if
   \[ \kappa_g^2(s_0) + \kappa_g^2(s_0)\tau_g^2(s_0) \neq 0, \quad u_0 = 2\kappa_g(s_0)\tau_g(s_0)\sigma^±(s_0), \quad v_0 = -2\kappa'_g(s_0)\sigma^±(s_0), \]
   \[ \kappa_S(s_0) = 0 \text{ and } \kappa'_S(s_0) \neq 0. \]
   In this case, each one of $LF^±_\gamma$ is locally diffeomorphic to the projection of the $C(2, 3, 4, 5)$-cusp.

Proof. By Propositions 5.1 and 5.2, the discriminant sets of $\mathcal{H}$ and $H$ are the lightcone duals of $\mathcal{F}$ and $\mathcal{Y}$ respectively. By Propositions 5.1 and 5.2, both of $\mathcal{F}_{v_0}$ and $h_{v_0}$ have $A_k$ singularities ($k = 1, 2, 3, 4$) respectively if and only if the above conditions on the geodesic curvatures and geodesic torsions hold. By Propositions 6.7 and 6.8, $\mathcal{H}$ and $H$ are versal unfoldings of $\mathcal{F}_{v_0}$ and $h_{v_0}$ at any point $s_0 \in I$ respectively. We apply Corollary 6.6, so that we have the above assertions.
