KOECHER-MAASS SERIES OF THE IKEDA LIFT FOR $U(m,m)$

HIDENORI KATSURADA

In memory of Professor Hiroshi Saito
Appearing in Kyoto Journal of Mathematics

Abstract. Let $K = \mathbb{Q}(\sqrt{-D})$ be an imaginary quadratic field with discriminant $-D$, and $\chi$ the Dirichlet character corresponding to the extension $K/\mathbb{Q}$. Let $m = 2n$ or $2n + 1$ with $n$ a positive integer. Let $f$ be a primitive form of weight $2k + 1$ and character $\chi$ for $\Gamma_0(D)$, or a primitive form of weight $2k$ for $SL_2(\mathbb{Z})$ according as $m = 2n$, or $m = 2n + 1$. For such an $f$ let $I_m(f)$ be the lift of $f$ to the space of Hermitian modular forms constructed by Ikeda. We then give an explicit formula of the Koecher-Maass series $L(s, I_m(f))$ of $I_m(f)$. This is a generalization of Mizuno [Mi06].

1. Introduction

In [Mi06], Mizuno gave explicit formulas of the Koecher-Maass series of the Hermitian Eisenstein series of degree two and of the Hermitian Maass lift. In this paper, we give an explicit formula of the Koecher-Maass series of the Hermitian Ikeda lift. Let $K = \mathbb{Q}(\sqrt{-D})$ be an imaginary quadratic field with discriminant $-D$, and $\chi$ the Kronecker character corresponding to the extension $K/\mathbb{Q}$. For a non-degenerate Hermitian matrix or alternating matrix $T$ with entries in $K$, let $U_T$ be the unitary group defined over $\mathbb{Q}$, whose group $U_T(R)$ of $R$-valued points is given by $U_T(R) = \{ g \in GL_m(R \otimes K) \mid \bar{\sigma} T g = T \}$ for any $\mathbb{Q}$-algebra $R$, where $\bar{\sigma}$ denotes the automorphism of $M_n(R \otimes K)$ induced by the non-trivial automorphism of $K$ over $\mathbb{Q}$. We also define the special unitary group $SU_T$ over $\mathbb{Q}$ by $SU_T = U_T \cap R_{K/\mathbb{Q}}(SL_m)$, where $R_{K/\mathbb{Q}}$ is the Weil restriction. In particular we write $U_T$ as $U^{(m)}$ or $U(m,m)$ if $T = \left( \begin{array}{cc} A & 0 \\ 0 & 1_m \end{array} \right)$. For a more precise description of $U^{(m)}$ see Section 2. Put $I_{K}^{(m)} = U(m,m)(\mathbb{Q}) \cap GL_{2m}(\mathcal{O})$. For a modular form $F$ of weight $2l$ and character $\psi$ for $I_{K}^{(m)}$ we define the Koecher-Maass series $L(s, F)$ of $F$ by

$$L(s, F) = \sum_T \frac{c_F(T)}{e^*(T)(\det T)^s},$$

where $T$ runs over all $SL_m(\mathcal{O})$-equivalence classes of positive definite semi-integral Hermitian matrices of degree $m$, $c_F(T)$ denotes the $T$-th Fourier coefficient of $F$, and $e^*(T) = \#(SU_T(\mathbb{Q}) \cap SL_m(\mathcal{O}))$. 

Date: 2014, February 17.

2010 Mathematics Subject Classification Primary 11F55, 11F67.
Let $k$ be a non-negative integer. Then for a primitive form $f \in \mathcal{S}_{2k+1}(I_0(D), \chi)$ Ikeda [Ike08] constructed a lift $I_{2n}(f)$ of $f$ to the space of modular forms of weight $2k + 2n$ and a character $\det^{-k-n}$ for $I_{K}^{(2n)}$. This is a generalization of the Maass lift considered by Kojima [Koj82], Gritsenko [Gri90], Krieg [Kri91] and Sugano [Su95]. Similarly for a primitive form $f \in \mathcal{S}_{2k}(SL_2(\mathbb{Z}))$ he constructed a lift $I_{2n+1}(f)$ of $f$ to the space of modular forms of weight $2k + 2n$ and a character $\det^{k+n}$ for $I_{K}^{(2n+1)}$. For the rest of this section, let $m = 2n$ or $m = 2n + 1$. We then call $I_{m}(f)$ the Ikeda lift of $f$ for $U(m,m)$ or the Hermitian Ikeda lift of degree $m$. Ikeda also showed that the automorphic form $\text{Lift}^{(m)}(f)$ on the adele group $U^{(m)}(\mathcal{A})$ associated with $I_{m}(f)$ is a cuspidal Hecke eigenform whose standard $L$-function coincides with

$$L(s + k + n - i + 1/2, f)L(s + k + n - i + 1/2, f, \chi),$$

where $L(s + k + n - i + 1/2, f)$ is the Hecke $L$-function of $f$ and $L(s + k + n - i + 1/2, f, \chi)$ is its “modified twist” by $\chi$. For the precise definition of $L(s + k + n - i + 1/2, f, \chi)$ see Section 2. We also call $\text{Lift}^{(m)}(f)$ the adelic Ikeda lift of $f$ for $U(m,m)$. Then we express the Koecher-Maass series of $I_{m}(f)$ in terms of the $L$-functions related to $f$. This result was already obtained in the case $m = 2$ by Mizuno [Mi06].

The method we use is similar to that in the proof of the main result of [IK04] or [IK06]. We explain it more precisely. In Section 3, we reduce our computation to a computation of certain formal power series $P_{m,p}(d; X, t)$ in $t$ associated with local Siegel series similarly to [IK04] (cf. Theorem 3.4 and Section 5).

Section 4 is devoted to the computation of them. This computation is similar to that in [IK04], but we should be careful in dealing with the case where $p$ is ramified in $K$. After such an elaborate computation, we can get explicit formulas of $P_{m,p}(d; X, t)$ for all prime numbers $p$ (cf. Theorems 4.3.1, 4.3.2, and 4.3.6). In Section 5, by using explicit formulas for $P_{m,p}(d; X, t)$, we immediately get an explicit formula of $L(s, I_{m}(f))$.

Using the same argument as in the proof our main result, we can give an explicit formula of the Koecher-Maass series of the Hermitian Eisenstein series of any degree, which can be regarded as a zeta function of a certain prehomogeneous vector space. We also note that the method used in this paper is useful for giving an explicit formula for the Rankin-Selberg series of the Hermitian Ikeda lift, and as a result we can prove the period relation of the Hermitian Ikeda lift, which was conjectured by Ikeda [Ike08]. We will discuss these topics in subsequent papers [Kat13] and [Kat14].

**Acknowledgments.** The author thanks Professor T. Watanabe and Professor R. Schulze-Pillot for giving him many crucial comments on the mass formula for the unitary group. He also thanks Professor Y. Mizuno, Professor T. Ikeda, and A. Yukie for useful discussions. The author was partly supported by JSPS KAKENHI Grant Number 24540005.

**Notation.** Let $R$ be a commutative ring. We denote by $R^{\times}$ and $R^{*}$ the semigroup of non-zero elements of $R$ and the unit group of $R$, respectively. For a subset $S$ of $R$ we denote by $M_{mn}(S)$ the set of $(m, n)$-matrices with entries in $S$. In particular put $M_{n}(S) = M_{nn}(S)$. Put $GL_{m}(R) = \{ A \in M_{m}(R) \vert \det A \in R^{*}\}$, where $\det A$ denotes the determinant of a square matrix $A$. Let $K$ be a field, and
$K$ a quadratic extension of $\mathcal{O}$, or $K = \mathcal{O} \oplus \mathcal{O}$. In the latter case, we regard $\mathcal{O}$ as a subring of $K$ via the diagonal embedding. We also identify $M_{nn}(K)$ with $M_{nn}(\mathcal{O}) \oplus M_{nn}(\mathcal{O})$ in this case. If $K$ is a quadratic extension of $\mathcal{O}$, let $\rho$ be the non-trivial automorphism of $K$ over $\mathcal{O}$, and if $K = \mathcal{O} \oplus \mathcal{O}$, let $\rho$ be the automorphism of $K$ defined by $\rho(a, b) = (b, a)$ for $(a, b) \in \mathcal{O}$. We sometimes write $\pi$ instead of $\rho(x)$ for $x \in K$ in both cases. Let $R$ be a subring of $K$. For an $(m, n)$-matrix $X = (x_{ij})_{m \times n}$, write $X^* = (\overline{x_{ij}})_{n \times m}$, and for an $(m, m)$-matrix $A$, we write $A[X] = X^*AX$. Let $\text{Her}_n(R)$ denote the set of Hermitian matrices of degree $n$ with entries in $R$, that is the subset of $M_n(R)$ consisting of matrices $X$ such that $X^* = X$. Then a Hermitian matrix $A$ of degree $n$ with entries in $K$ is said to be semi-integral over $R$ if $\text{tr}(AB) \in \mathcal{O} \cap R$ for any $B \in \text{Her}_n(R)$, where $\text{tr}$ denotes the trace of a matrix. We denote by $\text{Her}_n(R)$ the set of semi-integral matrices of degree $n$ over $R$.

For a subset $S$ of $\text{Her}_n(R)$ we denote by $S^\times$ the subset of $S$ consisting of non-degenerate matrices. If $S$ is a subset of $\text{Her}_n(\mathbb{C})$ with $\mathbb{C}$ the field of complex numbers, we denote by $S^+$ the subset of $S$ consisting of positive definite matrices. The group $GL_n(R)$ acts on the set $\text{Her}_n(R)$ in the following way:

$$GL_n(R) \times \text{Her}_n(R) \ni (g, A) \rightarrow g^*Ag \in \text{Her}_n(R).$$

Let $G$ be a subgroup of $GL_n(R)$. For a $G$-stable subset $\mathcal{B}$ of $\text{Her}_n(R)$ we denote by $\mathcal{B}/G$ the set of equivalence classes of $\mathcal{B}$ under the action of $G$. We sometimes identify $\mathcal{B}/G$ with a complete set of representatives of $\mathcal{B}/G$. We abbreviate $\mathcal{B}/GL_n(R)$ as $\mathcal{B}/G$ if there is no fear of confusion. Two Hermitian matrices $A$ and $A'$ with entries in $R$ are said to be $G$-equivalent and write $A \sim_G A'$ if there is an element $X$ of $G$ such that $A' = A[X]$. For square matrices $X$ and $Y$ we write $X \perp Y = \begin{pmatrix} X & O \\ O & Y \end{pmatrix}$.

We put $e(x) = \exp(2\pi \sqrt{-1}x)$ for $x \in \mathbb{C}$, and for a prime number $p$ we denote by $e_p(\cdot)$ the continuous additive character of $\mathbb{Q}_p$ such that $e_p(x) = e(x)$ for $x \in \mathbb{Z}[p^{-1}]$.

For a prime number $p$ we denote by $\text{ord}_p(\cdot)$ the additive valuation of $\mathbb{Q}_p$ normalized so that $\text{ord}_p(p) = 1$, and put $|x|_p = p^{-\text{ord}_p(x)}$. Moreover we denote by $|x|_\infty$ the absolute value of $x \in \mathbb{C}$. Let $K$ be an imaginary quadratic field, and $\mathcal{O}$ the ring of integers in $K$. For a prime number $p$ put $K_p = K \otimes \mathbb{Q}_p$, and $\mathcal{O}_p = \mathcal{O} \otimes \mathbb{Z}_p$. Then $K_p$ is a quadratic extension of $\mathbb{Q}_p$ or $K_p \cong \mathbb{Q}_p \oplus \mathbb{Q}_p$. In the former case, for $x \in K_p$, we denote by $\overline{x}$ the conjugate of $x$ over $\mathbb{Q}_p$. In the latter case, we identify $K_p$ with $\mathbb{Q}_p \oplus \mathbb{Q}_p$, and for $x = (x_1, x_2)$ with $x_i \in \mathbb{Q}_p$, we put $\overline{x} = (x_2, x_1)$. For $x \in K_p$ we define the norm $N_{K_p/\mathbb{Q}_p}(x)$ by $N_{K_p/\mathbb{Q}_p}(x) = x\overline{x}$, and put $\nu_{K_p}(x) = \text{ord}_p(N_{K_p/\mathbb{Q}_p}(x))$, and $|x|_{K_p} = |N_{K_p/\mathbb{Q}_p}(x)|_P$. Moreover put $|x|_{\infty} = |x\overline{x}|_\infty$ for $x \in \mathbb{C}$.

2. Main results

For a positive integer $N$ let

$$I_0(N) = \left\{ \begin{pmatrix} a & b \\ c & d \end{pmatrix} \in SL_2(\mathbb{Z}) \mid c \equiv 0 \mod N \right\},$$

and for a Dirichlet character $\psi$ mod $N$, we denote by $\mathbb{M}_1(I_0(N), \psi)$ the space of modular forms of weight $l$ for $I_0(N)$ and nebentype $\psi$, and by $\mathbb{E}_l(I_0(N), \psi)$ its subspace consisting of cusp forms. We simply write $\mathbb{M}_1(I_0(N), \psi)$ (resp. $\mathbb{E}_l(I_0(N), \psi)$) as $\mathbb{M}_1(N)$ (resp. as $\mathbb{E}_l(N)$) if $\psi$ is the trivial character.

Throughout the paper, we fix an imaginary quadratic extension $K$ of $\mathbb{Q}$ with discriminant $-D$, and denote by $\mathcal{O}$ the ring of integers in $K$. For such a $K$ let $U^{(m)} =$
$U(m, m)$ be the unitary group defined in Section 1. Put \( J_m = \begin{pmatrix} O_m & -1_m \\ 1_m & O_m \end{pmatrix} \), where \( 1_m \) denotes the unit matrix of degree \( m \). Then

\[
\mathcal{U}^{(m)}(Q) = \{ M \in GL_{2m}(K) \mid J_m[M] = J_m \}.
\]

Put

\[
\Gamma^{(m)} = \Gamma_K^{(m)} = \mathcal{U}^{(m)}(Q) \cap GL_{2m}(O).
\]

Let \( \mathcal{O}_m \) be the Hermitian upper half-space defined by

\[
\mathcal{O}_m = \{ Z \in M_m(C) \mid \frac{1}{2\sqrt{-1}}(Z - Z^*) \text{ is positive definite} \}.
\]

The group \( \mathcal{U}^{(m)}(R) \) acts on \( \mathcal{O}_m \) by

\[
g(Z) = (AZ + B)(CZ + D)^{-1}
\]

for \( g = (A \ B) \in \mathcal{U}^{(m)}(R), Z \in \mathcal{O}_m \).

We also put \( j(g, Z) = \det(CZ + D) \) for such \( Z \) and \( g \). Let \( l \) be an integer. For a subgroup \( \Gamma \) of \( \mathcal{U}^{(m)}(Q) \) commensurable with \( \Gamma^{(m)} \) and a character \( \psi \) of \( \Gamma \), we denote by \( \mathfrak{M}_l(\Gamma, \psi) \) the space of holomorphic modular forms of weight \( l \) with character \( \psi \) for \( \Gamma \). We denote by \( \mathfrak{M}_l(\Gamma, \psi) \) the subspace of \( \mathfrak{M}_l(\Gamma, \psi) \) consisting of cusp forms. In particular, if \( \psi \) is the character of \( \Gamma \) defined by \( \psi(\gamma) = (\det \gamma)^{-1} \) for \( \gamma \in \Gamma \), we write \( \mathfrak{M}_l(\Gamma, \psi) \) as \( \mathfrak{M}_l(\Gamma, \psi) \), and so on. Let \( F(z) \) be an element of \( \mathfrak{M}_l(\Gamma^{(m)}, \psi^{-1}) \).

We then define the Koecher-Maass series \( L(s, F) \) for \( F \) by

\[
L(s, F) = \sum_{T \in \text{Hom}(\mathcal{O}) / SL_m(\mathcal{O})} \frac{c_F(T)}{(\det(T)^* e^*(T)},
\]

where \( c_F(T) \) denotes the \( T \)-th Fourier coefficient of \( F \), and \( e^*(T) = \#(SU_T(Q) \cap SL_m(\mathcal{O})) \).

Now we consider the adelic modular form. Let \( A \) be the adele ring of \( Q \), and \( A_f \) the non-archimedian factor of \( A \). Let \( h = h_K \) be a class number of \( K \). Let \( G^{(m)} = \text{Res}_{K/Q}(GL_m) \), and \( G^{(m)}(A) \) be the adelization of \( G^{(m)} \). Moreover put \( C^{(m)} = \prod_p GL_m(\mathcal{O}_p) \). Let \( \mathcal{U}^{(m)}(A) \) be the adelization of \( \mathcal{U}^{(m)} \). We define the compact subgroup \( K^{(m)}_0 \) of \( \mathcal{U}^{(m)}(A_f) \) by \( \mathcal{U}^{(m)}(A_f) \cap \prod_p GL_{2m}(\mathcal{O}_p) \), where \( p \) runs over all rational primes. Then we have

\[
\mathcal{U}^{(m)}(A) = \prod_{i=1}^h \mathcal{U}^{(m)}(Q)_{\gamma_i} K^{(m)}_0 \mathcal{U}^{(m)}(R)
\]

with some subset \( \{ \gamma_1, ..., \gamma_h \} \) of \( \mathcal{U}^{(m)}(A_f) \). We can take \( \gamma_i \) as

\[
\gamma_i = \begin{pmatrix} t_i & 0 \\ 0 & t_i^{*-1} \end{pmatrix},
\]

where \( \{ t_i \}_{i=1}^h = \{ (t_i, p) \}_{i=1}^h \) is a certain subset of \( G^{(m)}(A_f) \) such that \( t_1 = 1 \), and

\[
G^{(m)}(A) = \prod_{i=1}^h G^{(m)}(Q) t_i G^{(m)}(R) C^{(m)}.
\]

Put \( \Gamma_i = \mathcal{U}^{(m)}(Q) \cap \gamma_i K_0 \gamma_i^{-1} \mathcal{U}^{(m)}(R) \). Then for an element \( (F_1, ..., F_h) \in \bigoplus_{i=1}^h \mathfrak{M}_2(\Gamma_i, \psi^{-1}) \), we define \( (F_1, ..., F_h)^{(x)}(y) = F_i(x(i))j(x, i)^{-2l(\det x)^l} \) by

\[
(F_1, ..., F_h)^{(x)}(y) = F_i(x(i))j(x, i)^{-2l(\det x)^l}.
\]
for $g = u_{\gamma,x}\kappa$ with $u \in U^{(m)}(Q), x \in U^{(m)}(R), \kappa \in K_p$. We denote by $M_{2\mathfrak{l}}(U^{(m)}(Q) \setminus U^{(m)}(A), \det^{-1})$ the space of automorphic forms obtained in this way. We also put

$$S_{2\mathfrak{l}}(U^{(m)}(Q) \setminus U^{(m)}(A), \det^{-1}) = \{ (F_1, \ldots, F_k)^2 \mid F_i \in S_{2\mathfrak{l}}(I_{\mathfrak{l}}, \det^{-1}) \}.$$  

We can define the Hecke operators which act on the space $M_{2\mathfrak{l}}(U^{(m)}(Q) \setminus U^{(m)}(A), \det^{-1})$. For the precise definition of them, see [Ike08].

Let $\text{Her}_m(O)$ be the set of semi-integral Hermitian matrices over $O$ of degree $m$ as in the Notation. We note that $A$ belongs to $\text{Her}_m(O)$ if and only if its diagonal components are rational integers and $\sqrt{-DA} \in \text{Her}_m(O)$. For a non-degenerate Hermitian matrix $B$ with entries in $K$ of degree $m$, put $\gamma(B) = (-D)^{m/2} \det B$.

Let $\text{Her}_m(O_p)$ be the set of semi-integral matrices over $O_p$ of degree $m$ as in the Notation. We put $\xi_p = 1, -1, 0$ according as $K_p = Q_p \oplus Q_p, K_p$ is an unramified quadratic extension of $Q_p$, or $K_p$ is a ramified quadratic extension of $Q_p$. For $T \in \text{Her}_m(O_p)^{\times}$ we define the local Siegel series $b_p(T, s)$ by

$$b_p(T, s) = \sum_{R \in \text{Her}_m(K_p)/\text{Her}_m(O_p)} \epsilon_p(\text{tr}(TR)) p^{-\text{ord}_p(\mu_p(R))s},$$

where $\mu_p(R) = [RO_p^m + O_p^m : O_p^m]$. We remark that there exists a unique polynomial $F_p(T, X)$ in $X$ such that

$$b_p(T, s) = F_p(T, p^{-s}) \prod_{i=0}^{[(m-1)/2]} (1 - p^{2i-s}) \prod_{i=1}^{[m/2]} (1 - \xi_p p^{2i-1-s})$$

(cf. Shimura [Sh97]). We then define a Laurent polynomial $\tilde{F}_p(T, X)$ as

$$\tilde{F}_p(T, X) = X^{-\text{ord}_p(\gamma(T))} F_p(T, p^{-m} X^2).$$

We remark that we have

$$\tilde{F}_p(T, X^{-1}) = (-D, \gamma(T))_p \tilde{F}_p(T, X) \quad \text{if } m \text{ is even,}$$

$$\tilde{F}_p(T, \xi_p X^{-1}) = \tilde{F}_p(T, X) \quad \text{if } m \text{ is even and } p \nmid D,$$

and

$$\tilde{F}_p(T, X^{-1}) = \tilde{F}_p(T, X) \quad \text{if } m \text{ is odd}$$

(cf. [Ike08]). Here $(a, b)_p$ is the Hilbert symbol of $a, b \in Q_p^\times$. Hence we have

$$\tilde{F}_p(T, X) = (-D, \gamma(B))_p^{m-1} X^{-\text{ord}_p(\gamma(T))} F_p(T, p^{-m} X^2).$$

Now we put

$$\text{Her}_m(O)_p^+ = \{ T \in \text{Her}_m(K)^+ \mid t_{p, T} t_{p, I_{\mathfrak{l}}} \in \text{Her}_m(O_p) \text{ for any } p \}. $$

First let $k$ be a non-negative integer, and $m = 2n$ a positive even integer. Let

$$f(z) = \sum_{N=1}^{\infty} a(N) e(Nz)$$

be a primitive form in $\mathbf{E}_{2k+1}(I_{\mathfrak{l}}(D), \chi)$. For a prime number $p$ not dividing $D$ let $\alpha_p \in \mathbf{C}$ such that $\alpha_p + \chi(p) \alpha_p^{-1} = p^{-k} a(p)$, and for $p \mid D$ put $\alpha_p = p^{-k} a(p)$. We note that $\alpha_p \neq 0$ even if $p \mid D$. Then for the Kronecker character $\chi$ we define Hecke’s $L$-function $L(s, f, \chi)$ twisted by $\chi^t$ as

$$L(s, f, \chi^t) = \prod_{p \mid D} \{(1 - \alpha_p p^{-s+k} \chi(p)) (1 - \alpha_p^{-1} p^{s+k} \chi(p)^{t+1}) \}^{-1}$$

KOECHER-MAASS SERIES OF THE IKEDA LIFT FOR $U(m, m)$
In particular, if $i$ is even, we sometimes write $L(s, f, \chi^i)$ as $L(s, f)$ as usual. Moreover for $i = 1, ..., h$ we define a Fourier series
\begin{equation*}
I_m(f)_i(Z) = \sum_{T \in \text{Her}_m(O)^+} a_{I_m(f)_i}(T)e(\text{tr}(TZ)),
\end{equation*}
where
\begin{equation*}
a_{I_m(f)_i}(T) = |\gamma(T)|^k \prod_p |\det(t_{i,p})\det(\overline{t_{i,p}})|_p^{|\alpha_p|} F_p(t_{i,p}, \alpha_p). \tag{1}
\end{equation*}
Next let $k$ be a positive integer and $m = 2n + 1$ a positive odd integer. Let
\begin{equation*}
f(z) = \sum_{N=1}^{\infty} a(N)e(Nz)
\end{equation*}
be a primitive form in $\mathfrak{E}_{2k}(SL_2(\mathbb{Z}))$. For a prime number $p$ let $\alpha_p \in \mathbb{C}$ such that $\alpha_p + \alpha_p^{-1} = p^{-k+1/2}a(p)$. Then we define Hecke's $L$-function $L(s, f, \chi^i)$ twisted by $\chi^i$ as
\begin{equation*}
L(s, f, \chi^i) = \prod_p \left\{ (1 - \alpha_p p^{s-k-1/2}\chi(p)^i)(1 - \alpha_p^{-1} p^{s-k-1/2}\chi(p)^i) \right\}^{-1}.
\end{equation*}
In particular, if $i$ is even we write $L(s, f, \chi^i)$ as $L(s, f)$ as usual. Moreover for $i = 1, ..., h$ we define a Fourier series
\begin{equation*}
I_{2n+1}(f)_i(Z) = \sum_{T \in \text{Her}_{2n+1}(O)^+} a_{I_{2n+1}(f)_i}(T)e(\text{tr}(TZ)),
\end{equation*}
where
\begin{equation*}
a_{I_{2n+1}(f)_i}(T) = |\gamma(T)|^{k-1/2} \prod_p |\det(t_{i,p})\det(\overline{t_{i,p}})|_p^{n+1/2} F_p(t_{i,p}, \alpha_p). \tag{2}
\end{equation*}

**Remark.** In [Ike08], Ikeda defined $\tilde{F}_p(T, X)$ as
\begin{equation*}
\tilde{F}_p(T, X) = X^{\text{ord}_p(\gamma(T))} F_p(T, p^{-m} X^{-2}),
\end{equation*}
and we define it by replacing $X$ with $X^{-1}$ in this paper. This change does not affect the results.

Then Ikeda [Ike08] showed the following:

**Theorem 2.1.** Let $m = 2n$ or $2n+1$. Let $f$ be a primitive form in $\mathfrak{E}_{2k+2}(\Gamma_0(D), \chi)$ or in $\mathfrak{E}_{2k}(SL_2(\mathbb{Z}))$ according as $m = 2n$ or $m = 2n+1$. Moreover let $\Gamma_i$ be the subgroup of $\mathcal{U}^{(m)}$ defined as above. Then $I_m(f)_i(Z)$ is an element of $\mathfrak{E}_{2k+2n}(\Gamma_i, \det^{-k-n})$ for any $i$. In particular, $I_m(f)_1$ is an element of $\mathfrak{E}_{2k+2n}(\Gamma^{(m)}, \det^{-k-n})$.

This is a Hermitian analogue of the lifting constructed in [Ike01]. We call $I_m(f)$ the Ikeda lift of $f$ for $\mathcal{U}^{(m)}$.

It follows from Theorem 2.1 that we can define an element $(I_m(f)_1, ..., I_m(f)_h)^{\mathbb{Z}}$ of $S_{2k+2n}(\mathcal{U}^{(m)}(\mathbb{Q})\backslash\mathcal{U}^{(m)}(\mathbb{A}), \det^{-k-n})$, which we write $\text{Lift}^{(m)}(f)$. 
Theorem 2.2. Let $m = 2n$ or $2n + 1$. Suppose that $\text{Lift}^{(m)}(f)$ is not identically zero. Then $\text{Lift}^{(m)}(f)$ is a Hecke eigenform in $\mathcal{S}_{2k+2m}(U^{(m)}(Q), U^{(m)}(A), \det^{-k-n})$ and its standard $L$-function $L(s, \text{Lift}^{(m)}(f), \chi)$ coincides with

$$
\prod_{i=1}^{m} L(s + k + n - i + 1/2, f) L(s + k + n - i + 1/2, f, \chi)
$$

up to bad Euler factors.

We call $\text{Lift}^{(m)}(f)$ the adelic Ikeda lift of $f$ for $U^{(m)}$.

Let $Q_D$ be the set of prime divisors of $D$. For each prime $q \in Q_D$, put $D_q = q^a \alpha_q(D)$. We define a Dirichlet character $\chi_q$ by

$$
\chi_q(a) = \begin{cases} 
\chi(a') & \text{if } (a, q) = 1 \\
0 & \text{if } q | a
\end{cases},
$$

where $a'$ is an integer such that

$$
a' \equiv a \mod D_q \quad \text{and} \quad a' \equiv 1 \mod DD_q^{-1}.
$$

For a subset $Q$ of $Q_D$ put $\chi_Q = \prod_{q \in Q} \chi_q$ and $\chi_Q' = \prod_{q \in Q_D, q \notin Q} \chi_q$. Here we make the convention that $\chi_Q = 1$ and $\chi_Q' = \chi$ if $Q$ is the empty set. Let

$$
f(z) = \sum_{N=1}^{\infty} c_f(N) e(Nz)
$$

be a primitive form in $\mathcal{S}_{2k+1}(I_0(D), \chi)$. Then there exists a primitive form

$$
f_Q(z) = \sum_{N=1}^{\infty} c_{f_Q}(N) e(Nz)
$$

such that

$$
c_{f_Q}(p) = \chi_Q(p)c_f(p) \text{ for } p \not\in Q
$$

and

$$
c_{f_Q}(p) = \chi_Q'(p)\overline{c_f(p)} \text{ for } p \in Q.
$$

Let $L(s, \chi^i) = \zeta(s)$ or $L(s, \chi)$ according as $i$ is even or odd, where $\zeta(s)$ and $L(s, \chi)$ are Riemann’s zeta function, and the Dirichlet $L$-function for $\chi$, respectively. Moreover we define $\Lambda(s, \chi^i)$ by

$$
\Lambda(s, \chi^i) = 2(2\pi)^{-s}\Gamma(s)L(s, \chi^i)
$$

with $\Gamma(s)$ the Gamma function.

Then our main results in this paper are as follows:

Theorem 2.3. Let $k$ be a nonnegative integer and $n$ a positive integer. Let $f$ be a primitive form in $\mathcal{S}_{2k+1}(I_0(D), \chi)$. Then, we have

$$
L(s, I_{2n}(f)) = D^{n^2+n^2-n/2-1/2}2^{-2n+1} \times \prod_{i=2}^{2n} \Lambda(i, \chi^i) \sum_{Q \subset Q_D} \chi_Q((-1)^n) \prod_{j=1}^{2n} L(s - 2n + j, f_Q, \chi^j).$$
Theorem 2.4. Let $k$ be a positive integer and $n$ a non-negative integer. Let $f$ be a primitive form in $\mathcal{S}_{2k}(SL_2(\mathbb{Z}))$. Then, we have

$$L(s, I_{2n+1}(f)) = D^{n+k^2+3n/2} \prod_{i=2}^{2n+1} A(i, \chi_i) \prod_{j=1}^{2n+1} L(s - 2n - 1 + j, f, \chi_j^{-1}).$$

Remark. We note that $L(s, I_{2n+1}(f))$ has an Euler product.

3. Reduction to local computations

To prove our main result, we reduce the problem to local computations. Let $K_p = K \otimes \mathbb{Q}_p$ and $\mathcal{O}_p = \mathcal{O} \otimes \mathbb{Z}_p$ as in Notation. Then $K_p$ is a quadratic extension of $\mathbb{Q}_p$ or $K_p = \mathbb{Q}_p \oplus \mathbb{Q}_p$. In the former case let $f_p$ be the exponent of the conductor of $K_p/\mathbb{Q}_p$. If $K_p$ is ramified over $\mathbb{Q}_p$, put $e_p = f_p - \delta_{2,p}$, where $\delta_{2,p}$ is Kronecker’s delta. If $K_p$ is unramified over $\mathbb{Q}_p$, put $e_p = f_p = 0$. In the latter case, put $e_p = f_p = 0$.

Let $K_p$ be a quadratic extension of $\mathbb{Q}_p$, and $\varpi = \varpi_p$ and $\pi = \pi_p$ be prime elements of $K_p$ and $\mathbb{Q}_p$, respectively. If $K_p$ is ramified over $\mathbb{Q}_p$, we take $\varpi = \pi = p$. If $K_p$ is unramified over $\mathbb{Q}_p$, we take $\pi$ so that $\pi = N_{K_p/\mathbb{Q}_p}(\varpi)$. Let $K_p = \mathbb{Q}_p \oplus \mathbb{Q}_p$. Then put $\varpi = \pi = p$. Let $\chi_{K_p}$ be the quadratic character of $\mathbb{Q}_p^2$ corresponding to the quadratic extension $K_p/\mathbb{Q}_p$. We note that we have $\chi_{K_p}(a) = (-D_0, a)_p$ for $a \in \mathbb{Q}_p^\times$ if $K_p = \mathbb{Q}_p(\sqrt{-D_0})$ with $D_0 \in \mathbb{Z}_p$. Moreover put $\text{Her}_m(\mathcal{O}_p) = p^\infty \text{Her}_m(\mathcal{O}_p)$. We note that $\text{Her}_m(\mathcal{O}_p) = \text{Her}_m(\mathcal{O}_p)$ if $K_p$ is not ramified over $\mathbb{Q}_p$. Let $K$ be an imaginary quadratic extension of $\mathbb{Q}$ with discriminant $-D$. We then put $\tilde{D} = \prod_{p \mid D} p^{e_p}$, and $\text{Her}_m(\mathcal{O}) = \text{DHer}_m(\mathcal{O})$. An element $X \in M_{ml}(\mathcal{O}_p)$ with $m \geq l$ is said to be primitive if there is an element $Y$ of $M_{m,m-l}(\mathcal{O}_p)$ such that $\langle X, Y \rangle \in GL_m(\mathcal{O}_p)$. If $K_p$ is a field, this is equivalent to saying that $\text{rank}_{\mathbb{Q}_p^\times / \mathbb{Q}_p^\times} X = l$. If $K_p = \mathbb{Q}_p \oplus \mathbb{Q}_p$, and $X = (X_1, X_2) \in M_{ml}(\mathbb{Z}_p) \oplus M_{ml}(\mathbb{Z}_p)$, this is equivalent to saying that $\text{rank}_{\mathbb{Z}_p^\times / \mathbb{Z}_p^\times} X_1 = \text{rank}_{\mathbb{Z}_p^\times / \mathbb{Z}_p^\times} X_2 = l$. Now let $m$ and $l$ be positive integers such that $m \geq l$. Then for an integer $a$ and $A \in \text{Her}_m(\mathcal{O}_p)$, $B \in \text{Her}_l(\mathcal{O}_p)$ put

$$A_{a}(A, B) = \{ X \in M_{ml}(\mathcal{O}_p)/p^a M_{ml}(\mathcal{O}_p) \mid A[X] - B \in p^a \text{Her}_l(\mathcal{O}_p) \},$$

and

$$B_{a}(A, B) = \{ X \in A_{a}(A, B) \mid X \text{ is primitive} \}.$$
where
\[ \Upsilon_a(A) = \{ X \in M_m(O_p) / p^e M_m(O_p) \mid A[X] - A \in p^e \text{Her}_m(O_p) \} . \]

The relation between \( \alpha_p(A) \) and \( v_p(A) \) is as follows:

**Lemma 3.1.** Let \( T \in \text{Her}_m(O_p)^{\times} \). Suppose that \( K_p \) is ramified over \( Q_p \). Then we have
\[ \alpha_p(T) = p^{-m(m+1)f_p/2 + m^2 \delta_{2,p}} v_p(T) . \]
Otherwise, \( \alpha_p(T) = v_p(T) \).

**Proof.** The proof is similar to that in [Kitaoka [Kit93], Lemma 5.6.5], and we here give an outline of the proof. The last assertion is trivial. Suppose that \( K_p \) is ramified over \( Q_p \). Let \( \{ T_i \}_{i=1}^l \) be a complete set of representatives of \( \text{Her}_m(O_p) / p^{r+e} \text{Her}_m(O_p) \) such that \( T_i \equiv T \mod p^r \text{Her}_m(O_p) \). Then it is easily seen that
\[ l = [p^r \text{Her}_m(O_p) : p^{r+e} \text{Her}_m(O_p)] = p^{m(m-1)f_p/2} . \]

Define a mapping
\[ \phi : \bigoplus_{i=1}^l \Upsilon_{r+e_p}(T_i) \longrightarrow \mathcal{A}_r(T, T) \]
by \( \phi(X) = X \mod p^r \). For \( X \in \mathcal{A}_r(T, T) \) and \( Y \in M_m(O_p) \) we have
\[ T[X + p^r Y] \equiv T[X] \mod p^r \text{Her}_m(O_p) . \]
Namely, \( X + p^r Y \) belongs to \( \Upsilon_{r+e_p}(T_i) \) for some \( i \) and therefore \( \phi \) is surjective. Moreover for \( X \in \mathcal{A}_r(T, T) \) we have \( \#(\phi^{-1}(X)) = p^{2m^2 e_p} \). For a sufficiently large integer \( r \) we have \( \#\Upsilon_{r+e_p}(T_i) = \#\Upsilon_{r+e_p}(T) \) for any \( i \). Hence
\[ p^{m(m-1)f_p/2} \#\Upsilon_{r+e_p}(T) = \sum_{i=1}^l \#\Upsilon_{r+e_p}(T_i) = p^{2m^2 e_p} \#\mathcal{A}_r(T, T) . \]
Recall that \( e_p = f_p - \delta_{2,p} \). Hence
\[ \#\Upsilon_{r+e_p}(T) = p^{m(m+1)f_p/2 - m^2 \delta_{2,p}} \#\mathcal{A}_r(T, T) . \]
This proves the assertion. \( \square \)

For \( T \in \text{Her}_m(K)^{\times} \), let \( \mathcal{G}(T) \) denote the set of \( SL_m(O) \)-equivalence classes of positive definite Hermitian matrices \( T' \) such that \( T' \) is \( SL_m(O_p) \)-equivalent to \( T \) for any prime number \( p \). Moreover put
\[ M^*(T) = \sum_{T' \in \mathcal{G}(T)} \frac{1}{e^*(T')} \]
for a positive definite Hermitian matrix \( T \) with entries in \( O \).

Let \( U_1 \) be the unitary group defined in Section 1. Namely let
\[ U_1 = \{ u \in R_K/Q(GL_1) \mid \pi u = 1 \} . \]
For an element \( T \in \text{Her}_m(O_p) \), let
\[ \tilde{U}_{p,T} = \{ \det X \mid X \in U_T(K_p) \cap GL_m(O_p) \} , \]
where
and put $U_{1,p} = U_p(K_p) \cap \mathcal{O}_p^*$. Then $U_{p,T}$ is a subgroup of $U_{1,p}$ of finite index. We then put $l_{p,T} = [U_{1,p} : U_{p,T}]$. We also put

$$u_p = \begin{cases} (1 + p^{-1})^{-1} & \text{if } K_p/Q_p \text{ is unramified} \\ (1 - p^{-1})^{-1} & \text{if } K_p = Q_p \oplus Q_p \\ 2^{-1} & \text{if } K_p/Q_p \text{ is ramified}. \end{cases}$$

To state the Mass formula for $SU_T$, put $\Gamma_C(s) = 2(2\pi)^{-s}\Gamma(s)$.

**Proposition 3.2.** Let $T \in \text{Her}_m(\mathcal{O})^+$. Then

$$M^*(T) = \frac{\det T)^m \prod_{j=1}^m \Gamma_C(i)}{2^{m-1} \prod_{p} l_{p,T} u_p v_p(T)}.$$  

**Proof.** The assertion is more or less well known (cf. [Re71].) But for the sake of completeness we here give an outline of the proof. Let $SU_T(\mathbf{A})$ be the adelization of $SU_T$ and let $\{x_i\}_{i=1}^H$ be a subset of $SU_T(\mathbf{A})$ such that

$$SU_T(A) = \bigsqcup_{i=1}^H Q x_i SU_T(Q),$$

where $Q = SU_T(\mathbf{R}) \prod_{p < \infty} (SU_T(K_p) \cap SL_m(\mathcal{O}_p))$. We note that the strong approximation theorem holds for $SL_m$. Hence, by using the standard method we can prove that

$$M^*(T) = \sum_{i=1}^H \frac{1}{\#(x_i^{-1}Q x_i \cap SU_T(Q))}.$$  

We recall that the Tamagawa number of $SU_T$ is 1 (cf. Weil [We82]). Hence, by [[Re71], (1.1) and (4.5)], we have

$$M^*(T) = \frac{(\det T)^m \prod_{j=1}^m \Gamma_C(i)}{2^{m-1} \prod_{p} l_{p,T} u_p v_p(T)}.$$  

We can easily show that $v_p(1) = u_p^{-1}$. This completes the assertion. \qed

**Corollary.** Let $T \in \hat{\text{Her}}_m(\mathcal{O})^+$. Then

$$M^*(T) = \frac{2^{c_D m^2} \det T)^m \prod_{j=1}^m \Gamma_C(i)}{2^{m-1} D^{m(m+1)/4 + 1/2} \prod_{p} u_p l_{p,T} \alpha_p(T)}.$$  

where $c_D = 1$ or 0 according as 2 divides $D$ or not.

For a subset $\mathcal{T}$ of $\mathcal{O}_p$ put

$$\text{Her}_m(\mathcal{T}) = \text{Her}_m(\mathcal{O}_p) \cap M_m(\mathcal{T}),$$

and for a subset $\mathcal{S}$ of $\mathcal{O}_p$ put

$$\text{Her}_m(\mathcal{S}, \mathcal{T}) = \{ A \in \text{Her}_m(\mathcal{T}) \mid \det A \in \mathcal{S} \},$$

and $\hat{\text{Her}}_m(\mathcal{S}, \mathcal{T}) = \text{Her}_m(\mathcal{S}, \mathcal{T}) \cap \hat{\text{Her}}_m(\mathcal{O}_p)$. In particular if $\mathcal{S}$ consists of a single element $d$ we write $\text{Her}_m(\mathcal{S}, \mathcal{T})$ as $\text{Her}_m(d, \mathcal{T})$, and so on. For $d \in \mathbb{Z}_{>0}$ we also define the set $\text{Her}_m(d, \mathcal{O})^+$ in a similar way. For each $T \in \text{Her}_m(\mathcal{O}_p)^+$ put

$$F_p^{(0)}(T, X) = F_p(p^{-e_p} T, X)$$
In addition to the above notation and the assumption, for a positive integer $d$

and

$$\widetilde{F}_p^{(0)}(T, X) = \widetilde{F}_p(p^{-s}T, X).$$

We remark that

$$\widetilde{F}_p^{(0)}(T, X) = X^{-\ord_p(\det T)}X^{e_p-m-f_p[m/2]}F_p^{(0)}(T, p^{-m}X^2).$$

For $d \in \mathbb{Z}_p^*$ put

$$\lambda_{m,p}(d, X) = \sum_{A \in \text{Her}_m(d, \mathcal{O}_p)/SL_m(\mathcal{O}_p)} \widetilde{F}_p^{(0)}(A, X) \alpha_{d,p}(A).$$

An explicit formula for $\lambda_{m,p}(p^id_0, X)$ will be given in the next section for $d_0 \in \mathbb{Z}_p^*$ and $i \geq 0$. Now let $\widetilde{\text{Her}}_m = \prod_p (\text{Her}_m(\mathcal{O}_p)/SL_m(\mathcal{O}_p))$. Then the diagonal embedding induces a mapping

$$\phi: \widetilde{\text{Her}}_m(O)/\prod_p SL_m(\mathcal{O}_p) \rightarrow \widetilde{\text{Her}}_m.$$

**Proposition 3.3.** In addition to the above notation and the assumption, for a positive integer $d$ let

$$\widetilde{\text{Her}}_m(d) = \prod_p (\text{Her}_m(d, \mathcal{O}_p)/SL_m(\mathcal{O}_p)).$$

Then the mapping $\phi$ induces a bijection from $\widetilde{\text{Her}}_m(d, O)/\prod_p SL_m(\mathcal{O}_p)$ to $\widetilde{\text{Her}}_m(d)$, which will be denoted also by $\phi$.

**Proof.** The proof is similar to that of [[IS95], Proposition 2.1], but it is a little bit more complex because the class number of $K$ is not necessarily one. It is easily seen that $\phi$ is injective. Let $(x_p) \in \widetilde{\text{Her}}_m(d)$. Then by Theorem 6.9 of [Sch85], there exists an element $y$ in $\text{Her}_m(K)^+$ such that $d\det y \in dN_{K/Q}(K^\times)$. Then we have $\det y \in \det x_p N_{K_p/Q}(K^\times)$ for any $p$. Thus by [[Jac62], Theorem 3.1] we have $x_p = g_p y g_p$ with some $g_p \in GL_m(K_p)$ for any prime number $p$. For $p$ not dividing $Dd$ we may suppose $g_p \in GL_m(\mathcal{O}_p)$. Hence $(g_p)$ defines an element of $R_{K/Q}(GL_m)(\mathcal{A}_F)$. Since we have $d^{-1} \det y \in Q^\times \cap \prod_p N_{K_p/Q}(K_p)$, we see that $d^{-1} \det y = N_{K/Q}(u)$ with some $u \in K^\times$. Thus, by replacing $y$ with $\left(\begin{array}{c|c} 1 & 0 \\ \hline 0 & u^{-1} \end{array}\right)$ $\left(\begin{array}{c|c} 1 & 0 \\ \hline 0 & u^{-1} \end{array}\right)$, we may suppose that $\det y = d$. Then we have $N_{K_p/Q}(\det g_p) = 1$. It is easily seen that there exists an element $\delta_p \in GL_m(K_p)$ such that $\det \delta_p = \det g_p^{-1}$ and $\delta_p x_p \delta_p = x_p$. Thus we have $g_p \delta_p \in SL_m(K_p)$ and

$$x_p = (g_p \delta_p)^* y g_p \delta_p.$$  

By the strong approximation theorem for $SL_m$ there exists an element $\gamma \in SL_m(K), \gamma_\infty \in SL_m(\mathcal{O})$, and $(\gamma_p) \in \prod_p SL_m(\mathcal{O}_p)$ such that

$$(g_p \delta_p) = \gamma \gamma_\infty (\gamma_p).$$

Put $x = \gamma^* y \gamma$. Then $x$ belongs to $\widetilde{\text{Her}}_m(d, O)^+$, and $\phi(x) = (x_p)$. This proves the surjectivity of $\phi$. \qed
Theorem 3.4. Let $f$ be a primitive form in $\mathfrak{g}_{2k+1}(\Gamma_0(D),\chi)$ or in $\mathfrak{g}_{2k}(SL_2(\mathbb{Z}))$ according as $m = 2n$ or $2n + 1$. For such an $f$ and a positive integer $d_0$ put

$$b_m(f; d_0) = \prod_p \lambda_{m,p}(d_0, \alpha_p^{-1}),$$

where $\alpha_p$ is the Satake $p$-parameter of $f$. Moreover put

$$\mu_{m,k,D} = D^{m(s-k+l_0/2)+(k-l_0/2)[m/2]-m(m+1)/4-1/2} \times 2^{-c_Dm(s-k-2n-l_0/2)-m+1} \prod_{i=2}^m \Gamma_C(i),$$

where $l_0 = 0$ or $1$ according as $m$ is even or odd. Then for $\text{Re}(s) > 0$, we have

$$L(s, I_m(f)) = \mu_{m,k,D} \sum_{d_0=1}^{\infty} b_m(f; d_0) d_0^{-s+k+2n+l_0/2}.$$

Proof. We note that $L(s, I_m(f))$ can be rewritten as

$$L(s, I_m(f)) = \tilde{D}^{ms} \sum_{T \in \overline{\text{Her}}_m(\mathcal{O})^+/SL_m(\mathcal{O})} \frac{a_{I_m(f)}(\tilde{D}^{-1}T)}{c^*(T)(\det T)^s}.$$

For $T \in \overline{\text{Her}}_m(\mathcal{O})^+$ the Fourier coefficient $a_{I_m(f)}(\tilde{D}^{-1}T)$ of $I_m(f)$ is uniquely determined by the genus to which $T$ belongs, and can be expressed as

$$a_{I_m(f)}(\tilde{D}^{-1}T) = (D^{m/2}\tilde{D}^{-m} \det T)^{k-l_0/2} \prod_p \tilde{F}_p^{(0)}(T, \alpha_p^{-1}).$$

Thus the assertion follows from Corollary to Proposition 3.2 and Proposition 3.3 similarly to [IS95].

4. Formal power series associated with local Siegel series

For $d_0 \in \mathbb{Z}_p^\times$ put

$$\tilde{P}_{m,p}(d_0, X, t) = \sum_{i=0}^{\infty} \lambda^*_{m,p}(p^i d_0, X) t^i,$$

where for $d \in \mathbb{Z}_p^\times$ we define $\lambda^*_{m,p}(d, X)$ as

$$\lambda^*_{m,p}(d, X) = \sum_{A \in \overline{\text{Her}}_m(dN_K/p, \mathcal{O}_p, \mathcal{O}_p)/GL_m(\mathcal{O}_p)} \frac{\tilde{F}_p^{(0)}(A, X)}{\alpha_p(A)}.$$

We note that

$$\sum_{A \in \overline{\text{Her}}_m(dN_K/p, \mathcal{O}_p, \mathcal{O}_p)/GL_m(\mathcal{O}_p)} \frac{\tilde{F}_p^{(0)}(A, X^{-1})}{\alpha_p(A)}$$

is $\chi_{K_p}((-1)^{m/2}d) \lambda^*_{m,p}(d, X)$ or $\lambda^*_{m,p}(d, X)$ according as $m$ is even and $K_p$ is a field, or not. In Proposition 4.3.7 we will show that we have

$$\lambda^*_{m,p}(d, X) = u_p \lambda_{m,p}(d, X).$$
for $d \in \mathbb{Z}_p^\times$ and therefore
\[ \hat{P}_{m,p}(d_0, X, t) = u_p \sum_{i=0}^{\infty} \lambda_{m,p}(p^i d_0, X) t^i. \]

We also define $P_{m,p}(d_0, X, t)$ as
\[ P_{m,p}(d_0, X, t) = \sum_{i=0}^{\infty} \lambda_{m,p}^*(p^i d_0, X) t^i. \]

We note that $P_{m,p}(d_0, X, t) = \hat{P}_{m,p}(d_0, X, t)$ if $K_p$ is unramified over $\mathbb{Q}_p$ or $K_p = \mathbb{Q}_p \oplus \mathbb{Q}_p$, but it is not necessarily the case if $K_p$ is ramified over $\mathbb{Q}_p$. In this section, we give explicit formulas of $P_{m,p}(d_0, X, t)$ for all prime numbers $p$ (cf. Theorems 4.3.1 and 4.3.2), and therefore explicit formulas for $\hat{P}_{m,p}(d_0, X, t)$ (cf. Theorem 4.3.6.)

From now on we fix a prime number $p$. Throughout this section we simply write $\text{ord}_p$ as $\text{ord}$ and so on if the prime number $p$ is clear from the context. We also write $\nu_K$ as $\nu$. We also simply write $\text{Her}_{m,p}$ instead of $\text{Her}_m(\mathcal{O}_p)$, and so on.

4.1. Preliminaries.

Let $m$ be a positive integer. For a non-negative integer $i \leq m$ let
\[ D_{m,i} = GL_m(\mathcal{O}_p) \left( \begin{array}{cc} 1_{m-i} & 0 \\ 0 & \varpi_1^i \end{array} \right) GL_m(\mathcal{O}_p), \]
and for $W \in D_{m,i}$, put $H_p(W) = (-1)^i p^{(i-1)/2}$, where $a = 2$ or $1$ according as $K_p$ is unramified over $\mathbb{Q}_p$ or not. Let $K_p = \mathbb{Q}_p \oplus \mathbb{Q}_p$. Then for a pair $i = (i_1, i_2)$ of non-negative integers such that $i_1, i_2 \leq m$, let
\[ D_{m,i} = GL_m(\mathcal{O}_p) \left( \begin{array}{cc} 1_{m-i_1} & 0 \\ 0 & p^{i_1}_1 \end{array} \right) \left( \begin{array}{cc} 1_{m-i_2} & 0 \\ 0 & p^{i_2}_1 \end{array} \right) GL_m(\mathcal{O}_p), \]
and for $W \in D_{m,i}$ put $H_p(W) = (-1)^{i_1+i_2} p^{i_1+i_2} (i_1-i_2)^2 + i_2(i_2-1)/2$. In either case $K_p$ is a quadratic extension of $\mathbb{Q}_p$, or $K_p = \mathbb{Q}_p \oplus \mathbb{Q}_p$, we put $H_p(W) = 0$ for $W \in M_n(\mathbb{Q}_p) \setminus \bigcup_{i=0}^{m} D_{m,i}$.

First we remark the following lemma, which can easily be proved by the usual Newton approximation method in $\mathcal{O}_p$:

**Lemma 4.1.1.** Let $A, B \in \text{Her}_m(\mathcal{O}_p)^\times$. Let $e$ be an integer such that $p^e A^{-1} \in \text{Her}_m(\mathcal{O}_p)$. Suppose that $A \equiv B \mod p^{e+1} \text{Her}_m(\mathcal{O}_p)$. Then there exists a matrix $U \in GL_m(\mathcal{O}_p)$ such that $B = A[U]$.

**Lemma 4.1.2.** Let $S \in \text{Her}_m(\mathcal{O}_p)^\times$ and $T \in \text{Her}_n(\mathcal{O}_p)^\times$ with $m \geq n$. Then
\[ \alpha_p(S, T) = \sum_{W \in GL_n(\mathcal{O}_p) \setminus M_n(\mathcal{O}_p)^\times} p^{(n-m)\varepsilon(\det W)} \beta_p(S, T[W^{-1}]). \]
Proof. The assertion can be proved by using the same argument as in the proof of [[Kit93], Theorem 5.6.1]. We here give an outline of the proof. For each 
\( W^{\infty} \) _{\mathfrak{m}}(\mathfrak{o})_n \), put 
\[
\mathcal{B}_e(S, T; W) = \{ X \in \mathcal{A}_e(S, T) \mid XW^{-1} \text{ is primitive} \}.
\]
Then we have 
\[
\mathcal{A}_e(S, T) = \bigcup_{W \in GL_n(\mathfrak{o}) \setminus M_n(\mathfrak{o}) \times} \mathcal{B}_e(S, T; W).
\]
Take a sufficiently large integer \( e \), and for an element \( W \) of \( M_n(\mathfrak{o})_n \), let \( \{ R_i \}_{i=1}^r \) be a complete set of representatives of \( p^ \nu \text{Her}_m(\mathfrak{o})[W^{-1}]/p^{\nu+1} \text{Her}_m(\mathfrak{o}) \). Then we have 
\[
\mathcal{B}_e(S, T; W) = \{ X \in M_{mn}(\mathfrak{o})/p^eM_{mn}(\mathfrak{o})W \mid [X] \equiv T \mod p^\nu \text{Her}_m(\mathfrak{o}) \}
\]
and \( XW^{-1} \) is primitive. 
Then 
\[
\#(\mathcal{B}_e(S, T; W)) = p^{\nu+e}\#(\mathcal{B}_e(S, T; W)).
\]
It is easily seen that 
\[
S[XW^{-1}] \equiv T[W^{-1}] + R_i \mod p^\nu \text{Her}_m(\mathfrak{o})
\]
for some \( i \). Hence the mapping \( X \mapsto XW^{-1} \) induces a bijection from \( \mathcal{B}_e(S, T; W) \) to \( \bigcup_{i=1}^r \mathcal{B}_e(S, T[W^{-1}] + R_i) \). Recall that \( \nu(W) \leq \text{ord}(\det T) \). Hence 
\[
R_i \equiv O \mod p^{e/2}\text{Her}_m(\mathfrak{o}),
\]
and therefore by Lemma 4.1.1, 
\[
T[W^{-1}] + R_i = T[W^{-1}][G]
\]
for some \( G \in GL_n(\mathfrak{o})_n \). Hence 
\[
\#(\mathcal{B}_e(S, T; W)) = p^{\nu+e}\#(\mathcal{B}_e(S, T[W^{-1}])).
\]
Hence 
\[
\alpha_p(S, T) = p^{-2m+c+n^2e}\#(\mathcal{A}_e(S, T))
\]
\[
= p^{-2m+c+n^2e} \sum_{W \in GL_n(\mathfrak{o})_n \setminus M_n(\mathfrak{o})_n \times} p^{\nu+e}\#(\mathcal{B}_e(S, T[W^{-1}])).
\]
This proves the assertion.

Now by using the same argument as in the proof of [[Kit83], Theorem 1], we obtain

Corollary. Under the same notation as above, we have 
\[
\beta_p(S, T) = \sum_{W \in GL_n(\mathfrak{o})_n \setminus M_n(\mathfrak{o})_n \times} p^{(n-m)\nu+e}\Pi_p(W)\alpha_p(S, T[W^{-1}]).
\]
For two elements \( A, A' \in \text{Hom}_m(\mathcal{O}_p) \) we simply write \( A \sim_{GL_m(\mathcal{O}_p)} A' \) as \( A \sim A' \) if there is no fear of confusion. For a variables \( U \) and \( q \) put

\[
(U, q)_m = \prod_{i=1}^{m} (1 - q^{-i} U), \quad \phi_m(q) = (q, q)_m.
\]

We note that \( \phi_m(q) = \prod_{i=1}^{m} (1 - q^i) \). Moreover for a prime number \( p \) put

\[
\phi_{m, p}(q) = \begin{cases} 
\phi_m(q^2) & \text{if } K_p/\mathcal{Q}_p \text{ is unramified} \\
\phi_m(q)^2 & \text{if } K_p = \mathcal{Q}_p \oplus \mathcal{Q}_p \\
\phi_m(q) & \text{if } K_p/\mathcal{Q}_p \text{ is ramified}
\end{cases}
\]

**Lemma 4.1.3.** (1) Let \( \Omega(S, T) = \{ w \in M_m(\mathcal{O}_p) \mid S[w] \sim T \} \). Then we have

\[
\frac{\alpha_p(S, T)}{\alpha_p(T)} = \#(\Omega(S, T)/GL_m(\mathcal{O}_p))p^{-m(\text{ord}(\det T) - \text{ord}(\det S))}.
\]

(2) Let \( \hat{\Omega}(S, T) = \{ w \in M_m(\mathbb{Z}) \mid S \sim T[w^{-1}] \} \). Then we have

\[
\frac{\alpha_p(S, T)}{\alpha_p(S)} = \#(GL_m(\mathcal{O}_p)\hat{\Omega}(S, T)).
\]

**Proof.** (1) The proof is similar to that of Lemma 2.2 of [BS87]. First we prove

\[
\int_{\Omega(S, T)} |dx| = \phi_{m, p}(p^{-1}) \frac{\alpha_p(S, T)}{\alpha_p(T)},
\]

where \( |dx| \) is the Haar measure on \( M_m(K_p) \) normalized so that

\[
\int_{M_m(\mathcal{O}_p)} |dx| = 1.
\]

To prove this, for a positive integer \( e \) let \( T_1, \ldots, T_l \) be a complete set of representatives of \( \{ T[\gamma] \mid \gamma \in GL_m(\mathcal{O}_p) \} \). Then it is easy to see that

\[
\int_{\Omega(S, T)} |dx| = p^{-2m^2 e} \sum_{i=1}^{l} \#(A_e(S, T_i))
\]

and, by Lemma 4.1.1, \( T_i \) is \( GL_m(\mathcal{O}_p) \)-equivalent to \( T \) if \( e \) is sufficiently large. Hence we have

\[
\#(A_e(S, T_i)) = \#(A_e(S, T))
\]

for any \( i \). Moreover we have

\[
l = \#(GL_m(\mathcal{O}_p/p^e \mathcal{O}_p))/\#(A_e(T, T)) = p^{m^2 e} \phi_{m, p}(p^{-1})/\alpha_p(T).
\]

Hence

\[
\int_{\Omega(S, T)} |dx| = lp^{-2m^2 e} \frac{\alpha_p(S, T)}{\alpha_p(T)} = \phi_{m, p}(p^{-1}) \frac{\alpha_p(S, T)}{\alpha_p(T)},
\]

which proves the above equality. Now we have

\[
\int_{\Omega(S, T)} |dx| = \sum_{W \in \Omega(S, T)/GL_m(\mathcal{O}_p)} |\det W|^p = \sum_{W \in \Omega(S, T)/GL_m(\mathcal{O}_p)} |\det W|^{m/|p|}.
\]

Remark that for any \( W \in \Omega(S, T)/GL_m(\mathcal{O}_p) \) we have \( |\det W|^{m/|p|} = p^{-m(\text{ord}(\det T) - \text{ord}(\det S))} \). Thus the assertion has been proved.
(2) By Lemma 4.1.2 we have
\[ \alpha_p(S, T) = \sum_{W \in GL_m(O_p) \setminus M_m(O_p)^*} \beta_p(S, T[W^{-1}]). \]
Then we have \( \beta_p(S, T[W^{-1}]) = \alpha_p(S) \) or 0 according as \( S \sim T[W^{-1}] \) or not. Thus the assertion (2) holds.

For a subset \( \mathcal{T} \) of \( O_p \), we put
\[ \text{Her}_m(\mathcal{T})_k = \{ A = (a_{ij}) \in \text{Her}_m(\mathcal{T}) \mid a_{ii} \in \pi^k \mathbb{Z}_p \}. \]
From now on put
\[ \text{Her}_{m,*}(O_p) = \left\{ \begin{array}{ll} \text{Her}_m(O_p)_1 & \text{if } p = 2 \text{ and } f_p = 3, \\ \text{Her}_m(\pi \mathcal{O}_p)_1 & \text{if } p = 2 \text{ and } f_p = 2, \\ \text{Her}_m(O_p) & \text{otherwise}, \end{array} \right. \]
where \( \pi \) is a prime element of \( K_p \). Moreover put \( i_p = 0 \), or 1 according as \( p = 2 \) and \( f_2 = 2 \), or not. Suppose that \( K_p/Q_p \) is unramified or \( K_p = Q_p \oplus Q_p \). Then an element \( B \) of \( \text{Her}_m(O_p) \) can be expressed as \( B \sim GL_n(O_p) \ 1_r \perp \pi^r B_2 \) with some integer \( r \) and \( B_2 \in \text{Her}_{m-r,*}(O_p) \). Suppose that \( K_p/Q_p \) is ramified. For an even positive integer \( r \) define \( \Theta_r \) by
\[ \Theta_r = \left( \begin{array}{cccc} 0 & \pi^r & \cdots & \pi^{r/2} \\ \pi^r & 0 & \cdots & \pi^{r/2} \\ \vdots & \vdots & \ddots & \vdots \\ \pi^r & \pi^r & \cdots & 0 \end{array} \right). \]
where \( \pi \) is the conjugate of \( \pi \) over \( Q_p \). Then an element \( B \) of \( \text{Her}_m(O_p) \) is expressed as \( B \sim GL_n(O_p) \Theta_r \perp \pi^r B_2 \) with some even integer \( r \) and \( B_2 \in \text{Her}_{m-r,*}(O_p) \). For these results, see Jacobowitz [Jac62].

A non-degenerate square matrix \( W = (d_{ij})_{m \times m} \) with entries in \( O_p \) is called reduced if \( W \) satisfies the following conditions:
- \( d_{ii} = p^{e_i} \) with \( e_i \) a non-negative integer,
- \( d_{ij} \) is a non-negative integer \( \leq p^{e_j} - 1 \) for \( i < j \) and \( d_{ij} = 0 \) for \( i > j \).

It is well known that we can take the set of all reduced matrices as a complete set of representatives of \( GL_m(O_p) \setminus M_m(O_p)^* \). Let \( m \) be an integer. For \( B \in \text{Her}_m(O_p) \) put
\[ \tilde{\Omega}(B) = \{ W \in GL_m(K_p) \cap M_m(O_p) \mid B[W^{-1}] \in \text{Her}_m(O_p) \}. \]

Let \( r \leq m \), and \( \psi_{r,m} \) be the mapping from \( GL_r(K_p) \) into \( GL_m(K_p) \) defined by \( \psi_{r,m}(W) = 1_{m-r} \perp W \).

**Lemma 4.1.4.** (1) Assume that \( K_p \) is unramified over \( Q_p \) or \( K_p = Q_p \oplus Q_p \). Let \( B_1 \in \text{Her}_{m-n_0}(O_p) \). Then \( \psi_{m-n_0,m} \) induces a bijection from \( GL_{m-n_0}(O_p) \setminus \tilde{\Omega}(B_1) \) to \( GL_m(O_p) \setminus \tilde{\Omega}(1_{n_0} \perp B_1) \), which will be also denoted by \( \psi_{m-n_0,m} \).

(2) Assume that \( K_p \) is ramified over \( Q_p \) and that \( n_0 \) is even. Let \( B_1 \in \text{Her}_{m-n_0}(O_p) \). Then \( \psi_{m-n_0,m} \) induces a bijection from \( GL_{m-n_0}(O_p) \setminus \tilde{\Omega}(B_1) \) to \( GL_m(O_p) \setminus \tilde{\Omega}(1_{n_0} \perp B_1) \), which will be also denoted by \( \psi_{m-n_0,m} \). Here \( i_p \) is the integer defined above.
Proof. (1) Clearly $\psi_{m-n_0,m}$ is injective. To prove the surjectivity, take a representative $W$ of an element of $GL_m(\mathcal{O}_p)\backslash \tilde{\Gamma}(1_{n_0},B_1)$. Without loss of generality we may assume that $W$ is a reduced matrix. Since we have $(1_{n_0},B_1)[W^{-1}] \in \text{Her}_m(\mathcal{O}_p)$, we have $W = \begin{pmatrix} 1_{n_0} & 0 \\ 0 & W_1 \end{pmatrix}$ with $W_1 \in \tilde{\Gamma}(B_1)$. This proves the assertion.

(2) The assertion can be proved in the same manner as (1). 

Lemma 4.1.5. Let $B \in \text{Her}_m(\mathcal{O}_p)^\times$. Then we have

$$\alpha_p(\pi^r dB) = p^{rm^2} \alpha_p(B)$$

for any non-negative integer $r$ and $d \in \mathbb{Z}_p^\times$.

Proof. The assertion can be proved by using the same argument as in the proof of (a) of Theorem 5.6.4 of Kitaoka [Ki2]. 

Now we prove induction formulas for local densities different from Lemma 4.1.2 (cf. Lemmas 4.1.6, 4.1.7, and 4.1.8.) For technical reason, we formulate and prove them in terms of Hermitian modules. Let $M$ be $\mathcal{O}_p$ free module, and let $b$ be a mapping from $M \times M$ to $K_p$ such that

$$b(\lambda_1 u + \lambda_2 u_2, v) = \lambda_1 b(u_1, v) + \lambda_2 b(u_2, v)$$

for $u, v \in M$ and $\lambda_1, \lambda_2 \in \mathcal{O}_p$, and

$$b(u, v) = \overline{b(v, u)}$$

for $u, v \in M$.

We call such an $M$ a Hermitian module with a Hermitian inner product $b$. We set $q(u) = b(u, u)$ for $u \in M$. Take an $\mathcal{O}_p$-basis $\{u_i\}_{i=1}^m$ of $M$, and put $T_M = (b(u_i, u_j))_{1 \leq i,j \leq m}$. Then $T_M$ is a Hermitian matrix, and its determinant is uniquely determined, up to $N_{K_p/\mathbb{Q}_p}(\mathcal{O}_p^\times)$, by $M$. We say $M$ is non-degenerate if $\det T_M \neq 0$. Conversely for a Hermitian matrix $T$ of degree $m$, we can define a Hermitian module $M_T$ so that

$$M_T = \mathcal{O}_p u_1 + \mathcal{O}_p u_2 + \cdots + \mathcal{O}_p u_m$$

with $(b(u_i, u_j))_{1 \leq i,j \leq m} = T$. Let $M_1$ and $M_2$ be submodules of $M$. We then write $M = M_1 \perp M_2$ if $M = M_1 + M_2$, and $b(u, v) = 0$ for any $u \in M_1, v \in M_2$. Let $M$ and $N$ be Hermitian modules. Then a homomorphism $\sigma : N \rightarrow M$ is said to be an isometry if $\sigma$ is injective and $b(\sigma(u), \sigma(v)) = b(u, v)$ for any $u, v \in N$. In particular $M$ is said to be isometric to $N$ if $\sigma$ is an isomorphism. We denote by $U_M$ the group of isometries of $M$ to $M$ itself. From now on we assume that $T_M \in \text{Her}_m(\mathcal{O}_p)$ for a Hermitian module $M$ of rank $m$. For Hermitian modules $M$ and $N$ over $\mathcal{O}_p$ of rank $m$ and $n$ respectively, put

$$A'_a(N, M) = \{ \sigma : N \rightarrow M/p^a M \mid q(\sigma(u)) \equiv q(u) \mod p^{r+u} \},$$

and

$$B'_a(N, M) := \{ \sigma \in A'_a(N, M) \mid \sigma \text{ is primitive} \}.$$ 

Here a homomorphism $\sigma : N \rightarrow M$ is said to be primitive if $\phi$ induces an injective mapping from $N/\omega N$ to $M/\omega M$. Then we can define the local density $\alpha'_a(N, M)$ as

$$\alpha'_a(N, M) = \lim_{a \rightarrow \infty} p^{-a(2mn-n^2)} \#(A'_a(N, M))$$
if $M$ and $N$ are non-degenerate, and the primitive local density $\beta_p'(N, M)$ as
$$
\beta_p'(N, M) = \lim_{n \to \infty} p^{-n(2mn-n^2)}\#(B_p'(N, M))
$$
if $M$ is non-degenerate as in the matrix case. It is easily seen that
$$
\alpha_p(S, T) = \alpha_p'(M_T, M_S),
$$
and
$$
\beta_p(S, T) = \beta_p'(M_T, M_S).
$$
Let $N_1$ be a submodule of $N$. For each $\phi_1 \in B_p'(N_1, M)$, put
$$
B_p'(N, M; \phi_1) = \{ \phi \in B_p'(N, M) \mid \phi|_{N_1} = \phi_1 \}.
$$
We note that we have
$$
B_p'(N, M) = \bigsqcup_{\phi_1 \in B_p'(N_1, M)} B_p'(N, M; \phi_1).
$$

Suppose that $K_p$ is unramified over $\mathbb{Q}_p$. Then put $\Xi_m = 1_m$. Suppose that $K_p$ is ramified over $\mathbb{Q}_p$, and that $m$ is even. Then put $\Xi_m = \Theta_m$.

**Lemma 4.1.6.** Let $m_1, m_2, n_1$, and $n_2$ be non-negative integers such that $m_1 \geq n_1$ and $m_1 + m_2 \geq n_1 + n_2$. Moreover suppose that $m_1$ and $n_1$ are even if $K_p$ is ramified over $\mathbb{Q}_p$. Let $A_2 \in \text{Her}_{m_2}(\mathcal{O}_p)$ and $B_2 \in \text{Her}_{n_2}(\mathcal{O}_p)$. Then we have
$$
\beta_p(\Xi_{m_1} \perp A_2, \Xi_{n_1} \perp B_2) = \beta_p(\Xi_{m_1} \perp A_2, \Xi_{n_1}) \beta_p(\Xi_{m_1-n_1} \perp A_2, B_2),
$$
and in particular we have
$$
\beta_p(\Xi_{n_1} \perp A_2, \Xi_{n_1} \perp B_2) = \beta_p(\Xi_{n_1} \perp A_2, \Xi_{n_1}) \beta_p(a_2, B_2).
$$

**Proof.** Let $M = M_{\Xi_{m_1} \perp A_2}, N_1 = M_{\Xi_{n_1}}, N_2 = M_{B_2}$, and $N = N_1 \perp N_2$. Let $a$ be a sufficiently large positive integer. Let $N_1 = \mathcal{O}_p\xi_1 \oplus \cdots \oplus \mathcal{O}_p\xi_{n_1}$ and $N_2 = \mathcal{O}_p\xi_{n_1+1} \oplus \cdots \oplus \mathcal{O}_p\xi_{n_1+n_2}$. For each $\phi_1 \in B_p'(N_1, M)$, put $u_i = \phi_1(\xi_i)$ for $i = 1, \cdots, n_1$. Then we can take elements $u_{m_1+1}, \cdots, u_{m_1+m_2} \in M$ such that
$$
(u_i, u_j) = 0 \ (i = 1, \cdots, n_1, \ j = n_1 + 1, \cdots, m_1 + m_2),
$$
and
$$
((u_i, u_j))_{n_1+1 \leq i, j \leq m_1+m_2} = \Xi_{m_1-n_1} \perp A_2.
$$
Put $N'_1 = \mathcal{O}_p\xi_1 \oplus \cdots \oplus \mathcal{O}_p\xi_{n_1}$. Then we have $N'_1 = M_{\xi_{n_1}}$. For $\phi \in B_p'(N_1, M; \phi_1)$ and $i = 1, \cdots, n_2$ we have
$$
\phi(\xi_{n_1+i}) = \sum_{j=1}^{m_1+m_2} a_{n_1+i, j} u_j
$$
with $a_{n_1+i, j} \in \mathcal{O}_p$. Put $\Xi_{n_1} = (b_{i,j})_{1 \leq i, j \leq n_1}$. Then we have
$$
(\phi(\xi_j), \phi(\xi_{n_1+i})) = \sum_{\gamma=1}^{n_1} a_{n_1+i, \gamma} b_{j, \gamma} = 0
$$
for $i = 1, \cdots, n_2$ and $j = 1, \cdots, n_1$. Hence we have $a_{n_1+i, \gamma} = 0$ for $i = 1, \cdots, n_2$ and $\gamma = 1, \cdots, n_1$. This implies that $\phi|_{N_2} \in B_p'(N_2, M_{A_2 \perp \Xi_{m_1-n_1}})$. Then the mapping
$$
B_p'(N_1, M; \phi_1) \ni \phi \mapsto \phi|_{N_2} \in B_p'(N_2, M_{A_2 \perp \Xi_{m_1-n_1}})
$$
In addition to the notation and the assumption in Lemma 4.1.6, the first assertion can easily be proved. By Lemmas 4.1.2 and 4.1.4, we have
\[ \beta_p(\Xi_{m_1} \perp A_2, \Xi_{n_1} \perp B_2) = \beta_p(\Xi_{m_1} \perp A_2, \Xi_{n_1}) \beta_p(\Xi_{m_1-n_1} \perp A, B_2). \]
Hence again by Lemma 4.1.2, we prove the second assertion.

Lemma 4.1.7. In addition to the notation and the assumption in Lemma 4.1.6, suppose that $A_1$ and $A_2$ are non-degenerate. Then
\[ \alpha_p(\Xi_{m_1} \perp A_2, \Xi_{n_1}) = \beta_p(\Xi_{m_1} \perp A_2, \Xi_{n_1}), \]
and we have
\[ \alpha_p(\Xi_{m_1} \perp A_2, \Xi_{n_1} \perp B_2) = \alpha_p(\Xi_{m_1} \perp A_2, \Xi_{n_1}) \alpha_p(\Xi_{m_1-n_1} \perp A, B_2), \]
and in particular we have
\[ \alpha_p(\Xi_{n_1} \perp A_2, \Xi_{n_1} \perp B_2) = \alpha_p(\Xi_{n_1} \perp A_2, \Xi_{n_1}) \alpha_p(A_2, B_2). \]

Proof. The first assertion can easily be proved. By Lemmas 4.1.2 and 4.1.4, we have
\[
\begin{align*}
\alpha_p(\Xi_{m_1} \perp A_2, \Xi_{n_1} \perp B_2) &= \sum_{W \in \text{GL}_{n_1+n_2}(\mathbb{Q}_p) \backslash \hat{\Gamma}(\Xi_{n_1} \perp B_2)} (n_1+n_2-(m_1+m_2))^{\nu(\det W)}\beta_p(\Xi_{m_1} \perp A_2, (\Xi_{n_1} \perp B_2)(W^{-1})) \\
&= \sum_{X \in \text{GL}_{n_2}(\mathbb{Q}_p) \backslash \hat{\Gamma}(B_2)} (n_2-(m_1-n_1+m_2))^{\nu(\det X)}\beta_p(\Xi_{m_1} \perp A_2, (\Xi_{n_1} \perp B_2)(X^{-1})).
\end{align*}
\]
By Lemma 4.1.6 and the first assertion, we have
\[ \beta_p(\Xi_{m_1} \perp A_2, \Xi_{n_1} \perp B_2[X^{-1}]) = \alpha_p(\Xi_{m_1} \perp A_2, \Xi_{n_1}) \beta_p(\Xi_{m_1-n_1} \perp A_2, B_2[X^{-1}]). \]
Hence again by Lemma 4.1.2, we prove the second assertion.

Lemma 4.1.8. (1) Suppose that $K_p$ is unramified over $\mathbb{Q}_p$. Let $A \in \text{Her}_1(\mathcal{O}_p), B_1 \in \text{Her}_{n_1}(\mathcal{O}_p)$ and $B_2 \in \text{Her}_{n_2}(\mathcal{O}_p)$ with $m \geq 2n_1$. Then we have
\[ \beta_p(1_m \perp A, B_1 \otimes B_2) = \beta_p(1_m \perp A, B_1) \beta_p(1_m \perp A, B_2). \]
(2) Suppose that $K_p$ is ramified over $\mathbb{Q}_p$. Let $A \in \text{Her}_1(\mathcal{O}_p), B_1 \in \text{Her}_{n_1}(\mathcal{O}_p)$, and $B_2 \in \text{Her}_{n_2}(\mathcal{O}_p)$ with $m \geq n_1$. Then we have
\[ \beta_p(\Theta_{2m} \perp A, B_1 \perp B_2) = \beta_p(\Theta_{2m} \perp A, B_1) \beta_p(\Theta_{2m} \perp A, B_2). \]

Proof. First suppose that $K_p$ is ramified over $\mathbb{Q}_p$. Let $M = M_{\text{Her}_{2m} \perp A}, N_1 = M_{B_1}, N_2 = M_{B_2}$, and $N = N_1 \perp N_2$. Let $a$ be a sufficiently large positive integer. Let $N_1 = \mathcal{O}_p v_{n_1} \oplus \cdots \oplus \mathcal{O}_p v_{n_1}$ and $N_2 = \mathcal{O}_p v_{n_1+1} \oplus \cdots \oplus \mathcal{O}_p v_{n_1+n_2}$. For each $\phi_i \in \mathcal{B}_a(N_1, M)$, put $u_i = \phi_i(v_{n_1})$ for $i = 1, \ldots, n_1$. Then we can take elements $u_{n_1+1}, \ldots, u_{2m+i} \in M$ such that
\[
\begin{align*}
(u_i, u_{n_1+i}) &= \delta_{ij} \varpi^i, \quad (u_{n_1+i}, u_{n_1+j}) = 0 \quad (i, j = 1, \ldots, n_1), \\
(u_i, u_j) &= 0 \quad (i = 1, \ldots, 2n_1, j = 2n_1 + 1, \ldots, 2m + l),
\end{align*}
\]
Lemma 4.1.9. Let $k$ be a positive integer.

1. Suppose that $K_p$ is unramified over $\mathbb{Q}_p$.

1.1. Let $b \in \mathbb{Z}_p$. Then we have

$$\beta_p(1_{2k}, pb) = (1 - p^{-2k})(1 + p^{-2k+1}).$$
(1.2) Let $b \in \mathbb{Z}_p^*$. Then we have
\[ \alpha_p(1_{2k}, b) = \beta_p(1_{2k}, b) = 1 - p^{-2k}, \]
and
\[ \alpha_p(1_{2k-1}, b) = \beta_p(1_{2k-1}, b) = 1 + p^{-2k+1}. \]

(2) Suppose that $K_p$ is ramified over $\mathcal{O}_p$.

(2.1) Let $B \in \text{Her}_{m,*}(\mathcal{O}_p)$ with $m \leq 2$. Then we have
\[ \beta_p(\Theta_{2k}, \pi^B) = \prod_{i=0}^{m-1} (1 - p^{-2k+2i}). \]

(2.2) Let $B = \left( \begin{smallmatrix} 0 & 0 \\ 1 & 0 \end{smallmatrix} \right)$. Then we have
\[ \alpha_p(\Theta_{2k}, B) = \beta_p(\Theta_{2k}, B) = 1 - p^{-2k}. \]

Proof. (1) Put $B = (b)$. Let $p \neq 2$. Then we have $K_p = \mathcal{O}_p(\sqrt{2})$ with $\varepsilon \in \mathbb{Z}_p^*$ such that $(\varepsilon, p)_p = -1$. Then we have
\[ \#B_a(1_{2k}, B) = \# \{(x_i) \in M_{4k,1}(\mathbb{Z}_p)/p^6M_{4k,1}(\mathbb{Z}_p) \mid (x_i) \not\equiv 0 \mod p, \]
\[ \sum_{i=1}^{2k} (x_{2i-1}^2 - \varepsilon x_{2i}^2) \equiv pb \mod p^6 \}. \]

Let $p = 2$. Then we have $K_2 = \mathcal{O}_2(\sqrt{3})$ and
\[ \#B_a(1_{2k}, B) = \# \{(x_i) \in M_{4k,1}(\mathbb{Z}_2)/2^6M_{4k,1}(\mathbb{Z}_2) \mid (x_i) \not\equiv 0 \mod 2, \]
\[ \sum_{i=1}^{2k} (x_{2i-1}^2 + x_{2i-1}x_{2i} + x_{2i}^2) \equiv 2b \mod 2^6 \}. \]

In any case, by Lemma 9 of [Kit84], we have
\[ \#B_a(1_{2k}, B) = \mu^{(4k-1)a}(1 - p^{-2k})(1 + p^{-2k+1}). \]

This proves the assertion (1.1). Similarly the assertion (1.2) holds.

(2) First let $m = 1$, and put $B = (b)$ with $b \in 2\mathbb{Z}_p$. Then $2^{-1}b \in \mathbb{Z}_p$. Let $p \neq 2$, or $p = 2$ and $f_2 = 3$. Then we have $K_p = \mathcal{O}_p(\varpi)$ with $\varpi$ a prime element of $K_p$ such that $\varpi^2 = -\varpi$. Then an element $\mathbf{x} = (x_{2i-1} + \varpi x_{2i})_{1 \leq i \leq 2k}$ of $M_{2k,1}(\mathcal{O}_p)/p^\delta M_{2k,1}(\mathcal{O}_p)$ is primitive if and only if $(x_{2i-1})_{1 \leq i \leq 2k} \not\equiv 0 \mod p$. Moreover we have
\[ \Theta_{2k}[\mathbf{x}] = 2 \sum_{1 \leq i \leq 2k} (x_{2i}x_{2i+1} + x_{2i-1}x_{2i+2}) \pi. \]

Hence we have
\[ \#B_a(1_{2k}, B) = \# \{(x_i) \in M_{4k,1}(\mathbb{Z}_p)/p^6M_{4k,1}(\mathbb{Z}_p) \mid (x_{2i-1})_{1 \leq i \leq 2k} \not\equiv 0 \mod p \]
\[ \sum_{i=1}^{2k} (x_{2i}x_{2i+1} - x_{2i-1}x_{2i+2}) \equiv 2^{-1}b \mod p^6 \}. \]

Let $p = 2$ and $f_2 = 2$. Then we have $K_2 = \mathcal{O}_2(\varpi)$ with $\varpi$ a prime element of $K_2$ such that $\eta := 2^{-1}(\varpi + \varpi^2) \in \mathbb{Z}_2^*$. Then we have
\[ \#B_a(1_{2k}, B) = \# \{(x_i) \in M_{4k,1}(\mathbb{Z}_2)/2^6M_{4k,1}(\mathbb{Z}_2) \mid (x_{2i-1})_{1 \leq i \leq 2k} \not\equiv 0 \mod 2, \]
\[ \sum_{i=1}^{2k} \eta(x_{2i}x_{2i+1} + x_{2i-1}x_{2i+2}) + x_{2i-1}x_{2i+1} + \pi x_{2i}x_{2i+2} \equiv 2^{-1}b \mod 2^6 \}. \]
Thus, in any case, by a simple computation we have
\[ \#B_a(1_{2k}, B) = p^{(2k-1)a}(p^{2ka} - p^{2k(a-1)}). \]
Thus the assertion (2.1) has been proved for \( m = 1 \). Next let \( \pi^a B = (b_{ij})_{1 \leq i, j \leq 2} \in \text{Her}_{2,2}(O_p) \). Let \( M = M_{2k}, N_1 = M_{2^1 \cdot 2}, \) and \( N = M_B \). Let \( a \) be a sufficiently large positive integer. For each \( \phi_i \in B'_a(N_1, M) \), put
\[ B'_a(N, M; \phi_i) = \{ \phi \in B'_a(N, M) \mid \phi|_{N_1} = \phi_1 \}. \]
Let \( N = O_p v_1 \oplus O_p v_2 \), and put \( u_1 = \phi_1(v_1) \). Then we can take elements \( u_2, \ldots, u_{2k} \in M \) such that
\[ M = O_p u_1 \oplus O_p u_2 \oplus \cdots \oplus O_p u_{2k} \]
and \( (u_1, u_2) = (u_2, u_3) = 0, (u_i, u_j) = 0 \) for \( i = 1, 2, \ldots, 2k \), and \( (u_i, u_j)_{1 \leq i, j \leq 2k} = \Theta_{2k-2} \).

Then by the same argument as in the proof of Lemma 4.1.8, we can prove that
\[ B'_a(N, M; \phi_1) = \{ (x_i)_{1 \leq i \leq 2k-1} \in M_{2k-1,1}(O_p) / p^a M_{2k-1,1}(O_p) \mid (x_i)_{2 \leq i \leq 2k-2} \equiv \Theta_{2k-2} \} = b_{22} \equiv \Theta_2 \mod p^a. \]

Hence by the assertion for \( m = 1 \), we have
\[ \beta_p(\Theta_{2k}, B) = \beta_p(\Theta_{2k, b_{11}}) p^{-a} \sum_{x_i \in C_p / \pi^a C_p} \beta_p(\Theta_{2k-2, b_{22} + b_{11}x_1 + x_1b_{22} + x_2b_{12}}) = (1 - p^{-2k})(1 - p^{-2k+2}). \]

Thus the assertion (2.1) has been proved for \( m = 2 \). The assertion (2.2) can be proved by using the same argument as above.

\[ \square \]

**Lemma 4.1.10.** Let \( k \) and \( m \) be integers with \( k \geq m \).

1. Suppose that \( K_p \) is unramified over \( Q_p \). Let \( A \in \text{Her}_1(O_p) \) and \( B \in \text{Her}_m(O_p) \). Then we have
\[ \beta_p(pA \perp 1_{2k}, pB) = \beta_p(1_{2k}, pB) = \prod_{i=0}^{2m-1} (1 - (-1)^i p^{-2k+i}). \]

2. Let \( K_p = Q_p \oplus Q_p \). Let \( l \) be an integer. Let \( B \in \text{Her}_m(O_p) \). Then we have
\[ \beta_p(1_{2k}, pB) = \prod_{i=0}^{2m-1} (1 - p^{-2k+i}). \]

3. Suppose that \( K_p \) is ramified over \( Q_p \). Let \( A \in \text{Her}_{1,2}(O_p) \) and \( B \in \text{Her}_{m,2}(O_p) \). Then we have
\[ \beta_p(\pi^a A \perp \Theta_{2k}, \pi^a B) = \beta_p(\Theta_{2k}, \pi^a B) = \prod_{i=0}^{m-1} (1 - p^{-2k+2i}). \]

**Proof.** (1) Suppose that \( K_p \) is unramified over \( Q_p \). We prove the assertion by induction on \( m \). Let \( \deg B = 1 \), and \( a \) be a sufficiently large integer. Then, by Lemma 4.1.9, we have
\[ \beta_p(pA \perp 1_{2k}, pB) = p^{-al} \sum_{x \in M_{1}(O_p) / p^a M_{1}(O_p)} \beta_p(1_{2k}, pB - pA[x])) \]
Let \( \deg B = 1 \) and suppose that the assertion holds for \( m - 1 \). Then \( B \) can be expressed as \( B \sim_{GL_m(O_p)} B_1 \perp B_2 \) with \( B_1 \in \text{Her}_1(O_p) \) and \( B_2 \in \text{Her}_{m-1}(O_p) \). Then by Lemma 4.1.8, we have

\[
\beta_p(pA \perp 1_{2k}, pB_1 \perp pB_2) = \beta_p(pA \perp 1_{2k}, pB_1) \beta_p(pA \perp (-pB_1) \perp 1_{2k-2}, pB_2).
\]

Thus the assertion holds by the induction assumption.

(2) Suppose that \( K_p = \mathbb{Q}_p \oplus \mathbb{Q}_p \). Then we easily see that we have

\[
\beta_p(1_{2k}, pB) = p^{(-4km+m^2)} \# B_1(1_{2k}, O_m).
\]

We have

\[
B_1(1_{2k}, O_m) = \{(X, Y) \in M_{2k,1}(\mathbb{Z}_p)|/pM_{2k,1}(\mathbb{Z}_p) \oplus M_{2k,1}(\mathbb{Z}_p)/pM_{2k,1}(\mathbb{Z}_p) | \top YX \equiv O_m \text{ mod } pM_m(\mathbb{Z}_p) \text{ and rank}_{Z_p/pZ_p} X = \text{rank}_{Z_p/pZ_p} Y = m \}.
\]

For each \( X \in M_{2k,1}(\mathbb{Z}_p)/pM_{2k,1}(\mathbb{Z}_p) \) such that \( \text{rank}_{Z_p/pZ_p} X = m \), put

\[
\# B_1(1_{2k}, O_m; X) = \{(Y) \in M_{2k,1}(\mathbb{Z}_p)/pM_{2k,1}(\mathbb{Z}_p) | \top YX \equiv O_m \text{ mod } pM_m(\mathbb{Z}_p) \text{ and rank}_{Z_p/pZ_p} Y = m \}.
\]

By a simple computation we have

\[
\# \{(X) \in M_{2k,1}(\mathbb{Z}_p)/pM_{2k,1}(\mathbb{Z}_p) | \text{rank}_{Z_p/pZ_p} X = m \} = \prod_{i=0}^{m-1} (p^{2k} - p^i),
\]

and

\[
\# B_1(1_{2k}, O_m; X) = \prod_{i=0}^{m-1} (p^{2k-m} - p^i).
\]

This proves the assertion.

(3) Suppose that \( K_p \) is ramified over \( \mathbb{Q}_p \). We prove the assertion by induction on \( m \). Let \( \deg B = 1 \), and \( a \) be a sufficiently large integer. Then, by Lemma 4.1.9, we have

\[
\beta_p(\pi^a A \perp \Theta_{2k}, \pi^a B) = p^{-al} \sum_{x \in M_{11}(O_p)/p^a M_{11}(O_p)} \beta_p(\Theta_{2k}, \pi^a B - \pi^a A[x]) = 1 - p^{-2k}.
\]

Let \( \deg B = 2 \). Then by Lemma 4.1.9, we have

\[
\beta_p(\pi^a A \perp \Theta_{2k}, \pi^a B) = p^{-2al} \sum_{x \in M_{12}(O_p)/p^a M_{12}(O_p)} \beta_p(\Theta_{2k}, \pi^a B - \pi^a A[x])
\]

\[
= (1 - p^{-2k})(1 - p^{-2k+2}).
\]

Let \( m \geq 3 \). Then \( B \) can be expressed as \( B \sim_{GL_m(O_p)} B_1 \perp B_2 \) with \( \deg B_1 \leq 2 \). Then this proves the assertion for \( m \) holds by Lemma 4.1.8, the induction hypotheses, and Lemma 4.1.9.

\[
\square
\]

**Lemma 4.1.11.** (1) Suppose that \( K_p \) is unramified over \( \mathbb{Q}_p \). Let \( l \) and \( m \) be an integers with \( l \geq m \). Then we have

\[
\alpha_p(1_l, 1_m) = \beta_p(1_l, 1_m) = \prod_{i=0}^{m-1} (1 - (-p)^{-l+i})
\]
(2) Let $K_p = \mathbb{Q}_p \oplus \mathbb{Q}_p$. Let $l$ and $m$ be integers with $l \geq m$. Then we have

$$\alpha_p(1, 1) = \beta_p(1, 1) = \prod_{i=0}^{m-1} (1 - p^{-l+i})$$

(3) Suppose that $K_p$ is ramified over $\mathbb{Q}_p$. Let $k$ and $m$ be even integers with $k \geq m$. Then we have

$$\alpha_p(\Theta_{2k}, \Theta_{2m}) = \beta_p(\Theta_{2k}, \Theta_{2m}) = m \prod_{i=0}^{m-1} (1 - p^{-2k+2i}).$$

Proof. In any case, we easily see that the local density coincides with the primitive local density. Suppose that $K_p$ is unramified over $\mathbb{Q}_p$. Then, by Lemma 4.1.7, we have

$$\alpha_p(1, 1) = \alpha_p(1, 1) \alpha_p(1, 1)$$

We easily see that we have

$$\alpha_p(1, 1) = 1 - (-1)^l p^{-l}.$$ This proves the assertion (1). Suppose that $K_p$ is ramified over $\mathbb{Q}_p$. Then by Lemma 4.1.7, we have

$$\alpha_p(\Theta_{2k}, \Theta_{2m}) = \alpha_p(\Theta_{2k}, \Theta_{2m}) \alpha_p(\Theta_{2k-2}, \Theta_{2m-2}).$$

Moreover by Lemma 4.1.9, we have

$$\alpha_p(\Theta_{2k}, \Theta_{2}) = 1 - p^{-2k}.$$ This proves the assertion (3). Suppose that $K_p = \mathbb{Q}_p \oplus \mathbb{Q}_p$. Then the assertion can be proved similarly to (2) of Lemma 4.1.10.

4.2. Primitive densities.

For an element $T \in \text{Her}_m(\mathcal{O}_p)$, we define a polynomial $G_p(T, X)$ in $X$ by

$$G_p(T, X) = \sum_{i=0}^{m} \sum_{W \in G_{\text{GL}}_m(\mathcal{O}_p) \backslash G_{\text{GL}}_m} (X p^m)^{\nu(\text{det } W)} \Pi_p(W) F^{(0)}_p(T[W^{-1}], X).$$

Lemma 4.2.1. (1) Suppose that $K_p$ is unramified over $\mathbb{Q}_p$. Let $B_1 \in \text{Her}_{m-n_0}(\mathcal{O}_p)$. Then we have

$$\alpha_p(1, n_0 \perp pB_1) = \prod_{i=1}^{n_0} (1 - (-1)^{-i}) \alpha_p(pB_1)$$

(2) Let $K_p = \mathbb{Q}_p \oplus \mathbb{Q}_p$. Let $B_1 \in \text{Her}_{m-n_0}(\mathcal{O}_p)$. Then we have

$$\alpha_p(1, n_0 \perp pB_1) = \prod_{i=1}^{n_0} (1 - p^{-i}) \alpha_p(pB_1)$$
(3) Suppose that $K_p$ is ramified over $Q_p$. Let $n_0$ be even. Let $B_1 \in \text{Her}_{m-n_0, \sigma}(O_p)$. Then we have
\[
\alpha_p(\Theta_{n_0} \perp \pi^i B_1) = \prod_{i=1}^{n_0/2} (1 - p^{-2i}) \alpha_p(\pi^i B_1).
\]

Proof. Suppose that $K_p$ is unramified over $Q_p$. By Lemma 4.1.7, we have
\[
\alpha_p(1_{n_0} \perp pB_1) = \alpha_p(1_{n_0} \perp pB_1, 1_{n_0}) \alpha_p(pB_1).
\]
By using the same argument as in the proof of Lemma 4.1.10, we can prove that we have
\[
\alpha_p(1_{n_0} \perp pB_1, 1_{n_0}) = \alpha_p(1_{n_0}),
\]
and hence by Lemma 4.1.11, we have
\[
\alpha_p(1_{n_0} \perp pB_1) = \prod_{i=1}^{n_0} (1 - (-p)^{-i}) \alpha_p(pB_1).
\]
This proves the assertion (1). Similarly the assertions (2) and (3) can be proved. \(\square\)

**Lemma 4.2.2.** Let $m$ be a positive integer and $r$ a non-negative integer such that $r \leq m$.

(1) Suppose that $K_p$ is unramified over $Q_p$. Let $T = 1_{m-r} \perp pB_1$ with $B_1 \in \text{Her}_r(O_p)$. Then
\[
\beta_p(1_{2k}, T) = \prod_{i=0}^{m+r-1} (1 - p^{-2k+i}(-1)^i).
\]

(2) Suppose that $K_p = Q_p \oplus Q_p$. Let $T = 1_{m-r} \perp pB_1$ with $B_1 \in \text{Her}_r(O_p)$. Then
\[
\beta_p(1_{2k}, T) = \prod_{i=0}^{m+r-1} (1 - p^{-2k+i}).
\]

(3) Suppose that $K_p$ is ramified over $Q_p$ and that $m-r$ is even. Let $T = \Theta_{m-r} \perp \pi^i B_1$ with $B_1 \in \text{Her}_{r, \sigma}(O_p)$.
Then
\[
\beta_p(\Theta_{2k}, T) = \prod_{i=0}^{(m+r-2)/2} (1 - p^{-2k+2i}).
\]

Proof. Suppose that $K_p$ is unramified over $Q_p$. By Lemma 4.1.8, we have
\[
\beta_p(1_{2k}, T) = \beta_p(1_{2k}, pB_1) \beta_p(-pB_1) \perp 1_{2k-2r, 1_{m-r}}.
\]
By using the same argument as in the proof of Lemma 4.1.11, we can prove that we have
\[
\beta_p((-pB_1) \perp 1_{2k-2r, 1_{m-r}}) = \beta_p(1_{2k-2r, 1_{m-r}}).\]
Hence the assertion follows from Lemmas 4.1.10 and 4.1.11. Similarly the assertions (2) and (3) can be proved. \(\square\)

**Corollary.** (1) Suppose that $K_p$ is unramified over $Q_p$ or $K_p = Q_p \oplus Q_p$. Let $T = 1_{m-r} \perp pB_1$ with $B_1 \in \text{Her}_r(O_p)$. Then we have
\[
G_p(T, Y) = \prod_{i=0}^{r-1} (1 - (\xi p)^{m+i}Y).
\]
(2) Suppose that $K_p$ is ramified over $Q_p$ and that $m - r$ is even. Let $T = \Theta_{m-r} \cdot \pi^B B_1$ with $B_1 \in \text{Her}_{r+}(O_p)$. Then

$$G_p(T, Y) = \prod_{i=0}^{\lceil (r-2)/2 \rceil} (1 - p^{2i+2i(m+1)/2})^Y.$$

Proof. Let $k$ be a positive integer such that $k \geq m$. Put $\Xi_{2k} = \Theta_{2k}$ or $\Xi_{2k}$ according as $K_p$ is ramified over $Q_p$ or not. Then it follows from Lemma 4 of [Sh97] that we have

$$b_p(B, 2k) = \alpha_p(\Xi_{2k}, B).$$

Hence, by the definition of $G_p(T, X)$ and Corollary to Lemma 4.1.2, we have

$$\beta_p(\Xi_{2k}, T) = G_p(T, p^{-2k}) \prod_{i=0}^{\lfloor (m-1)/2 \rfloor} (1 - p^{2i-2k})^\prod_{i=1}^{[m/2]} (1 - p^{2i-1-2k}).$$

Suppose that $K_p$ is unramified over $Q_p$ or $K_p = Q_p \oplus Q_p$. Then by Lemma 4.2.2, we have

$$G_p(T, p^{-2k}) = \prod_{i=0}^{p-1} (1 - (\xi_p p)^m + p^{-2k}).$$

This equality holds for infinitely many positive integer $k$, and the both hand sides of it are polynomials in $p^{-2k}$. Thus the assertion (1) holds. Similarly the assertion (2) holds.

**Lemma 4.2.3.** Let $B \in \widetilde{\text{Her}}_m(O_p)$. Then we have

$$F^{(0)}_p(B, X) = \sum_{W \in \text{GL}_m(O_p) \setminus \tilde{G}(B)} G_p(B[W^{-1}], X(p^m X)^{\nu(\text{det} W)}).$$

Proof. Let $k$ be a positive integer such that $k \geq m$. By Lemma 4.1.2, we have

$$\alpha_p(\Xi_{2k}, B) = \sum_{W \in \text{GL}_m(O_p) \setminus \tilde{G}(B)} \beta_p(\Xi_{2k}, B[W^{-1}]) p^{(-2k+m)\nu(\text{det} W)}.$$

Then the assertion can be proved by using the same argument as in the proof of Corollary to Lemma 4.2.2.

**Corollary.** Let $B \in \text{Her}_m(O_p)$. Then we have

$$\tilde{F}^{(0)}(B, X) = X^{e_p m - f_p [m/2]} \sum_{B' \in \text{Her}_m(O_p) / \text{GL}_m(O_p)} X^{-\text{ord}(\text{det} B')} \frac{\alpha_p(B', B)}{\alpha_p(B')} \times G_p(B', p^{-m} X^2)^{\nu(\text{det} B) - \text{ord}(\text{det} B')},$$

Proof. We have

$$\tilde{F}^{(0)}(B, X) = X^{e_p m - f_p [m/2]} \sum_{W \in \text{GL}_m(O_p) \setminus \tilde{G}(B)} X^{-\text{ord}(\text{det} B')} G_p(B[W^{-1}], p^{-m} X^2)(X^2)^{\nu(\text{det} W)}$$

$$= X^{e_p m - f_p [m/2]} \sum_{W \in \text{GL}_m(O_p) \setminus \tilde{G}(B)} \sum_{B' \in \text{Her}_m(O_p) / \text{GL}_m(O_p)} G_p(B', p^{-m} X^2)(X^2)^{\nu(\text{det} W)}$$

$$\times \sum_{B' \in \text{Her}_m(O_p) / \text{GL}_m(O_p)} X^{-\text{ord}(\text{det} B')} G_p(B', p^{-m} X^2)(X^2)^{\nu(\text{det} W)}.$$
KOECHER-MAASS SERIES OF THE IKEDA LIFT FOR \( U(m, m) \)

\[
X^{e_{m} - f_{p}[m/2]} \sum_{B' \in \text{Her}_m(O_p)/GL_m(O_p)} X^{-\text{ord}(\det B')} \#(GL_m(O_p) \setminus \tilde{\Omega}(B', B)) \\
\times G_p(B', p^{-m} X^2)^{\text{ord}(\det B) - \text{ord}(\det B')}.
\]

Thus the assertion follows from (2) of Lemma 4.1.3. \( \square \)

Let

\[
\mathcal{F}_{m, p, *}(d_0) = \bigcup_{i=0}^{\infty} (\text{Her}_m(\pi^i d_0 N_{K_p}/Q_p) (O_p^*, O_p) \cap \text{Her}_r(O_p)).
\]

First suppose that \( K_p \) is unramified over \( Q_p \) or \( K_p = Q_p \oplus Q_p \). Let \( H_m \) be a function on \( \text{Her}_r(O_p)^\times \) satisfying the following condition:

\[
H_m(1_{m-r} p B) = H_r(p B) \quad \text{for any } B \in \text{Her}_r(O_p).
\]

Let \( d_0 \in Z_p^* \). Then we put

\[
Q(d_0, H_m, r, t) = \sum_{B \in p^{-r} \mathcal{F}_{r, p}(d_0) \cap \text{Her}_r(O_p)} H_m(1_{m-r} p B)^{\phi_r(1_{m-r} p B)}.
\]

Next suppose that \( K_p \) is ramified over \( Q_p \). Let \( H_m \) be a function on \( \text{Her}_r(O_p)^\times \) satisfying the following condition:

\[
H_m(\Theta_{m-r} \pi^r B) = H_r(\pi^r B) \quad \text{for any } B \in \text{Her}_r(O_p) \text{ if } m - r \text{ is even}.
\]

Let \( d_0 \in Z_p^* \) and \( m - r \) be even. Then we put

\[
Q(d_0, H_m, r, t) = \sum_{B \in \pi^r \mathcal{F}_{r, p}(d_0) \cap \text{Her}_r(O_p)} H_m(\Theta_{m-r} \pi^r B)^{\phi_r(\Theta_{m-r} \pi^r B)}.
\]

Then by Lemma 4.2.1 we easily obtain the following.

**Proposition 4.2.4.** (1) Suppose that \( K_p \) is unramified over \( Q_p \) or \( K_p = Q_p \oplus Q_p \). Then for any \( d_0 \in Z_p^* \) and a non-negative integer \( r \) we have

\[
Q(d_0, H_m, r, t) = \frac{Q(d_0, H_r, r, t)}{\phi_{m-r}(\pi p^{r-1})}.
\]

(2) Suppose that \( K_p \) is ramified over \( Q_p \). Then for any \( d_0 \in Z_p^* \) and a non-negative integer \( r \) such that \( m - r \) is even, we have

\[
Q(d_0, H_m, r, t) = \frac{Q(d_0, H_r, r, t)}{\phi_{(m-r)/2}(p^{r-1})}.
\]
4.3. Explicit formulas of formal power series of Koecher-Maass type.

In this section we give an explicit formula for \( P_m(d_0, X, t) \).

**Theorem 4.3.1.** Let \( m \) be even, and \( d_0 \in \mathbb{Z}_p^* \).

1. Suppose that \( K_p \) is unramified over \( \mathbb{Q}_p \). Then
   \[
   P_m(d_0, X, t) = \frac{1}{\phi_m(p^{-1}) \prod_{i=1}^{m}(1 - t(-p)^{-i}X)(1 + t(-p)^{-i}X^{-1})}.
   \]

2. Suppose that \( K_p = \mathbb{Q}_p \oplus \mathbb{Q}_p \). Then
   \[
   P_m(d_0, X, t) = \frac{1}{\phi_m(p^{-1}) \prod_{i=1}^{m}(1 - tp^{-i}X)(1 - tp^{-i}X^{-1})}.
   \]

3. Suppose that \( K_p \) is ramified over \( \mathbb{Q}_p \). Then
   \[
   P_m(d_0, X, t) = \frac{t^{m/p/2}}{2\phi_m(2(p^{-2})} \times \left\{ \frac{1}{\prod_{i=1}^{m/2}(1 - tp^{-2i+1}X^{-1})(1 - tp^{-2i}X)} + \frac{\chi_K_p((-1)^{m/2}d_0)}{\prod_{i=1}^{m/2}(1 - tp^{-2i}X^{-1})(1 - tp^{-2i+1}X)} \right\}.
   \]

**Theorem 4.3.2.** Let \( m \) be odd, and \( d_0 \in \mathbb{Z}_p^* \).

1. Suppose that \( K_p \) is unramified over \( \mathbb{Q}_p \). Then
   \[
   P_m(d_0, X, t) = \frac{1}{\phi_m(p^{-1}) \prod_{i=1}^{m}(1 + t(-p)^{-i}X)(1 + t(-p)^{-i}X^{-1})}.
   \]

2. Suppose that \( K_p = \mathbb{Q}_p \oplus \mathbb{Q}_p \). Then
   \[
   P_m(d_0, X, t) = \frac{1}{\phi_m(p^{-1}) \prod_{i=1}^{m}(1 - tp^{-i}X)(1 - tp^{-i}X^{-1})}.
   \]

3. Suppose that \( K_p \) is ramified over \( \mathbb{Q}_p \). Then
   \[
   P_m(d_0, X, t) = \frac{1}{2\phi(m-1)/2(p^{-2})} \prod_{i=1}^{(m+1)/2}(1 - tp^{-2i+1}X)(1 - tp^{-2i+1}X^{-1}) \times \frac{t^{(m+1)p/2 + \delta_p}}{\prod_{i=1}^{m/2}(1 - tp^{-2i}X^{-1})(1 - tp^{-2i+1}X^{-1})}.
   \]

To prove Theorems 4.3.1 and 4.3.2, put
\[
K_m(d_0, X, t) = \sum_{B' \in \mathcal{B}_{m,p}(d_0)} \frac{G_p(B', p^{-m}X^2)}{\alpha_p(B')}(tX^{-1})^{ord(B')},
\]

**Proposition 4.3.3.** Let \( m \) and \( d_0 \) be as above. Then we have
\[
P_m(d_0, X, t) = X^{m_p - [m/2]}m_p K_m(d_0, X, t)
\]

\[
\times \left\{ \begin{array}{ll}
\prod_{i=1}^{m}(1 - tp^{-i}X^{-1}) \quad & \text{if } K_p/\mathbb{Q}_p \text{ is unramified} \\
\prod_{i=1}^{m}(1 - tp^{i-1}X^{-1})^{-2} \quad & \text{if } K_p = \mathbb{Q}_p \oplus \mathbb{Q}_p \\
\prod_{i=1}^{m}(1 - tp^{i-1}X^{-1})^{-1} \quad & \text{if } K_p/\mathbb{Q}_p \text{ is ramified}.
\end{array} \right.
\]

**Proof.** We note that \( B' \) belongs to \( \text{He}_{m,p}(d_0) \) if \( B \) belongs to \( \text{He}_{m-1,p}(d_0) \) and \( \alpha_p(B', B) \neq 0 \). Hence by Corollary to Lemma 4.2.3 we have
\[
P_m(d_0, X, t) = X^{m_p - [m/2]}m_p \sum_{B \in \mathcal{B}_{m,p}(d_0)} \frac{1}{\alpha_p(B')} \sum_{B'} G_p(B', p^{-m}X^2)X^{-\ord(B')} \alpha_p(B', B)
\]
Let
\[\text{obtain an explicit formula of}
\]
\[\text{(3.1)}\]
\[\text{positive integer}\]
\[\text{Suppose that}\]
\[\text{where}\]
\[u\]
\[\text{We make the convention that}\]
\[\text{Thus the assertion holds.}\]
\[\text{(1) of Lemma 4.1.3, we have}\]
\[\text{Hence by using the same argument as in the proof of }[[\text{BS87}}, \text{Theorem 5}}, \text{and by}\]
\[\text{Proposition 4.3.4.}\]
\[\text{Suppose that}\]
\[\text{(2)}\]
\[\text{In order to prove Theorems 4.3.1 and 4.3.2, we introduce some notation. For a}\]
\[\text{m}\]
\[\text{K}\]
\[\text{is unramified}\]
\[\text{is ramified over}\]
\[\text{Then by Theorem 4.2 of }[\text{Sa97}}\text{we obtain:}\]
\[\text{Then}\]
\[\text{Z}_{m,\ast}(u, d) = \int_{\mathcal{F}_{m,\ast}(d_0)} \text{det} x^{|s-m}|dx|,
\]
\[\text{where } u = p^{-s}, \text{and } |dx| \text{ is the measure on } \text{Her}_m(K_p) \text{ so that the volume of } \text{Her}_m(O_p) \text{ is 1. Then by Theorem 4.2 of }[\text{Sa97}}\text{we obtain:}\]
\[\text{Proposition 4.3.4. Let } d_0 \in \mathbb{Z}_p^\times \text{ let}\]
\[\zeta_m(d_0, t) = \sum_{T \in \mathcal{F}_{m,\ast}(d_0)} \frac{1}{\alpha_p(T)^{\text{ord(det T)}}},\]
\[\text{We make the convention that } \zeta_0(d_0, t) = 1 \text{ or 0 according as } d_0 \in \mathbb{Z}_p^\times \text{ or not. To}\]
\[\text{obtain an explicit formula of } \zeta_m(d_0, t) \text{ let } Z_{m}(u, d) \text{ be the integral defined as}\]
\[\text{where } u = p^{-s}, \text{and } |dx| \text{ is the measure on } \text{Her}_m(K_p) \text{ so that the volume of } \text{Her}_m(O_p) \text{ is 1. Then by Theorem 4.2 of }[\text{Sa97}}\text{we obtain:}\]
\[\text{Proposition 4.3.4. Let } d_0 \in \mathbb{Z}_p^\times \text{.}\]
\[\text{(1) Suppose that } K_p \text{ is unramified over } \mathbb{Q}_p. \text{ Then}\]
\[\text{Z}_{m,\ast}(u, d_0) = \frac{(p^{-1}, p^{-2})_{[(m+1)/2]}(-p^{-2}, p^{-2})_{[m/2]}}{\prod_{i=1}^{m} (1 - (-1)^{m+i} p^{i+1} u)}.
\]
\[\text{(2) Suppose that } K_p = \mathbb{Q}_p \oplus \mathbb{Q}_p. \text{ Then}\]
\[\text{Z}_{m,\ast}(u, d_0) = \prod_{i=1}^{m} \phi_m(p^{-1}) \frac{1}{1 - p^{i+1} u}.
\]
\[\text{(3) Suppose that } K_p \text{ is ramified over } \mathbb{Q}_p.\]
\[\text{(3.1) Let } p \neq 2. \text{ Then}\]
\[\text{Z}_{m,\ast}(u, d_0) = \frac{1}{2} \frac{(p^{-1}, p^{-2})_{[(m+1)/2]}}{1 - p^{i+1} u}.\]
First suppose that $K_p$ is unramified over $\mathbb{Q}_p$. $K_p = \mathbb{Q}_p \oplus \mathbb{Q}_p$, or $K_p$ is ramified over $\mathbb{Q}_p$ and $p \neq 2$. Then $Z_m(u, d_0)$ coincides with $Z_m(u, d_0)$ in [[Sa97], Theorem 4.2]. Hence the assertion follows from (1) and (2) and the former half of (3) of [loc. cit]. Next suppose that $p = 2$ and $f_2 = 3$. Then $Z_m(u, d_0)$ is not treated in [loc. cit], but we can prove the assertion (3.2) using the same argument as in the proof of the latter half of (3) of [loc. cit]. Similarly we can prove (3.3) by using the same argument as in the proof of the former half of (3) of [loc. cit].

\[ Z_m(u, d_0) = \frac{1}{2}(p^{-1}, p^{-2}) [(m+1)/2] \]

(3.2) Let $p = 2$ and $f_2 = 2$. Then

\[ Z_m(u, d_0) = \frac{1}{2}(p^{-1}, p^{-2}) [(m+1)/2] \]

(3.3) Let $p = 2$ and $f_2 = 3$. Then

\[ Z_m(u, d_0) = \frac{1}{2}(p^{-1}, p^{-2}) [(m+1)/2] \]

Proof. First suppose that $K_p$ is unramified over $\mathbb{Q}_p$, $K_p = \mathbb{Q}_p \oplus \mathbb{Q}_p$, or $K_p$ is ramified over $\mathbb{Q}_p$ and $p \neq 2$. Then $Z_m(u, d_0)$ coincides with $Z_m(u, d_0)$ in [[Sa97], Theorem 4.2]. Hence the assertion follows from (1) and (2) and the former half of (3) of [loc. cit]. Next suppose that $p = 2$ and $f_2 = 2$. Then $Z_m(u, d_0)$ is not treated in [loc. cit], but we can prove the assertion (3.2) using the same argument as in the proof of the latter half of (3) of [loc. cit]. Similarly we can prove (3.3) by using the same argument as in the proof of the former half of (3) of [loc. cit].

Corollary. Let $d_0 \in \mathbb{Z}_p^*$.

1. Suppose that $K_p$ is unramified over $\mathbb{Q}_p$. Then

\[ \zeta_m(d_0, t) = \frac{1}{\phi_m(-p^{-1})} \frac{1}{\prod_{i=1}^{m} (1 + (-1)^{p^{-i}} t)} \]

2. Suppose that $K_p = \mathbb{Q}_p \oplus \mathbb{Q}_p$. Then

\[ \zeta_m(d_0, t) = \frac{1}{\phi_m(p^{-1})} \frac{1}{\prod_{i=1}^{m} (1 - p^{-i} t)} \]

3. Suppose that $K_p$ is ramified over $\mathbb{Q}_p$.

3.1 Let $m$ be even. Then

\[ \zeta_m(d_0, t) = \frac{p^{m(m+1)/2} f_p/2 - m^2 d_2 \cdot K_p(t)}{2\phi_m(2)} \]

\[ \times \left\{ \frac{1}{\prod_{i=1}^{m/2} (1 - p^{-2i+1} t)} + \frac{\chi_{K_p}((-1)^{m/2} d_0) p^{-i m/2}}{\prod_{i=1}^{m/2} (1 - p^{-2i} t)} \right\}, \]

where $i_p = 0$, or 1 according as $p = 2$ and $f_p = 2$, or not, and

\[ \kappa_p(t) = \begin{cases} 1/t^{m/2} p^{-m(m+1)/2} & \text{if } p \neq 2 \\ p^{-m} & \text{if } p = 2 \text{ and } f_2 = 2 \\ p^{-m} & \text{if } p = 2 \text{ and } f_2 = 3 \end{cases} \]
(3.2) Let $m$ be odd. Then
\[
\zeta_m(d_0, t) = \frac{p^{m(m+1)f_p/2-m^2s_p}K_m(t)}{2\phi(m-1/2)(p-2)} \frac{1}{\prod_{i=1}^{m+1/2} (1 - p^{-2i+1} t)},
\]
where
\[
K_m(t) = \begin{cases} 
1 & \text{if } p \neq 2 \\
t^{(m+1)/2}p^{-m(m+1)/2} & \text{if } p = 2 \text{ and } f_2 = 2 \\
kp^{-m} & \text{if } p = 2 \text{ and } f_2 = 3
\end{cases}
\]

Proof. First suppose that $K_p$ is unramified over $Q_p$. Then by a simple computation
we have
\[
\zeta_m(d_0, t) = \frac{Z_{m,*}(p^{-m} t, d_0)}{\phi_m(p^{-2})}.
\]
Next, suppose that $K_p = Q_p \oplus Q_p$. Then similarly to above
\[
\zeta_m(d_0, t) = \frac{Z_{m,*}(p^{-m} t, d_0)}{\phi_m(p^{-1})^2}.
\]
Finally, suppose that $K_p$ is ramified over $Q_p$. Then by a simple computation and
Lemma 3.1
\[
\zeta_m(d_0, t) = \frac{p^{m(m+1)f_p/2-m^2s_p}Z_{m,*}(p^{-m} t, d_0)}{\phi_m(p^{-1})}.
\]
Thus the assertions follow from Proposition 4.3.4.

\[\square\]

**Proposition 4.3.5.** Let $d_0 \in Z_p^*$. 
(1) Suppose that $K_p$ is unramified over $Q_p$. Then
\[
K_m(d_0, X, t) = \sum_{r=0}^{m} p^{-r^2} (tX^{-1})^r \frac{\prod_{i=0}^{r-1} (1 - (-1)^m(-p)^iX^2)}{\phi_m(-p^{-1})} \zeta_r(d_0, tX^{-1}).
\]
(2) Suppose that $K_p = Q_p \oplus Q_p$. Then
\[
K_m(d_0, X, t) = \sum_{r=0}^{m} p^{-r^2} (tX^{-1})^r \frac{\prod_{i=0}^{r-1} (1 - p^iX^2)}{\phi_m(-p^{-1})} \zeta_r(d_0, tX^{-1}).
\]
(3) Suppose that $K_p$ is ramified over $Q_p$. Then
\[
K_m(d_0, X, t) = \sum_{r=0}^{m/2} p^{-4r^2} (tX^{-1})^{(m/2+r)r} \frac{\prod_{i=0}^{r-1} (1 - p^{2i}X^2)}{\phi_m(-2r)/2(p^{-2})} \zeta_{2r}((-1)^{m/2-r}d_0, tX^{-1})
\]
if $m$ is even, and
\[
K_m(d_0, X, t) = \sum_{r=0}^{(m-1)/2} p^{-4(r+1)^2} (tX^{-1})^{(m+1)/2(r)} \frac{\prod_{i=0}^{r-1} (1 - p^{2i+1}X^2)}{\phi_m(-2r-1)/2(p^{-2})} \zeta_{2r+1}((-1)^{(m-2r-1)/2}d_0, tX^{-1})
\]
if $m$ is odd.

Proof. The assertions can be proved by using Corollary to Lemma 4.2.2 and Proposition 4.2.4 (cf. [IK06], Proposition 3.1). \[\square\]
It is well known that \( \#(\mathbb{Z}_p^*/\mathcal{N}_p) = 2 \) if \( \mathcal{N}_p \) is ramified. Hence we can take a complete set \( \mathcal{N}_p \) of representatives of \( \mathbb{Z}_p^*/\mathcal{N}_p \) so that \( \mathcal{N}_p = \{1, \xi_0\} \) with \( \chi_{\mathcal{N}_p}(\xi_0) = -1 \).

**Proof of Theorem 4.3.1.** (1) By Corollary to Proposition 4.3.4 and Proposition 4.3.5, we have

\[
K_m(d_0, X, t) = \frac{1}{\phi_m(-p^{-1})} \frac{L_m(d_0, X, t)}{1 + (1 + (-1)^{p^{-1}}X^{-1}t)^2},
\]

where \( L_m(d_0, X, t) \) is a polynomial in \( t \) of degree \( m \). Hence

\[
P_m(d_0, X, t) = \frac{1}{\phi_m(-p^{-1})} \frac{L_m(d_0, X, t)}{1 + (1 + (-1)^{p^{-1}}X^{-1}t)^2}.
\]

We have

\[
\tilde{F}(B, -X^{-1}) = \tilde{F}(B, X)
\]

for any \( B \in \tilde{F}_p(B, X) \). Hence we have

\[
P_m(d_0, -X^{-1}, t) = P_m(d_0, X, t),
\]

and therefore the denominator of the rational function \( P_m(d_0, X, t) \) in \( t \) is at most

\[
(1 + (1 + (-1)^{p^{-1}}X^{-1}t)) \prod_{i=1}^{m}(1 - (-1)^{p^{-1}}X^i).
\]

Thus

\[
P_m(d_0, X, t) = \frac{a}{\phi_m(-p^{-1}) \prod_{i=1}^{m}(1 + (1 + (-1)^{p^{-1}}X^{-1}t)) \prod_{i=1}^{m}(1 - (-1)^{p^{-1}}X^i)},
\]

with some constant \( a \). It is easily seen that we have \( a = 1 \). This proves the assertion.

(2) The assertion can be proved by using the same argument as above.

(3) By Corollary to Proposition 4.3.4 and Proposition 4.3.5, we have

\[
K_m(d, X, t) = \frac{1}{2} \left\{ \frac{L^{(0)}(X, t)}{\prod_{i=1}^{m/2}(1 - p^{-2i+1}X^{-1}t)} + \frac{\chi_{\mathcal{N}_p}((-1)^{m/2}d_a)L^{(1)}(X, t)}{\prod_{i=1}^{m/2}(1 - p^{-2i}X^{-1}t)} \right\}
\]

with some polynomials \( L^{(0)}(X, t) \) and \( L^{(1)}(X, t) \) in \( t \) of degrees at most \( m \). Thus we have

\[
P_m(d, X, t) = \frac{1}{2} \left\{ \frac{L^{(0)}(X, t)}{\prod_{i=1}^{m/2}(1 - p^{-2i+1}X^{-1}t)} \prod_{i=1}^{m/2}(1 - p^{-1}X^i) + \frac{\chi_{\mathcal{N}_p}((-1)^{m/2}d_a)L^{(1)}(X, t)}{\prod_{i=1}^{m/2}(1 - p^{-2i}X^{-1}t)} \prod_{i=1}^{m/2}(1 - p^{-1}X^i) \right\}.
\]

For \( l = 0, 1 \) put

\[
P_m^{(l)}(X, t) = \frac{1}{2} \sum_{d \in \mathcal{N}_p} \chi_{\mathcal{N}_p}((-1)^{m/2}d)^l P_m(d, X, t).
\]

Then

\[
P_m^{(0)}(X, t) = \frac{1}{2 \phi_{m/2}(p^{-2}) \prod_{i=1}^{m/2}(1 - p^{-2i+1}X^{-1}t)} \prod_{i=1}^{m/2}(1 - p^{-1}X^i),
\]

and

\[
P_m^{(1)}(X, t) = \frac{1}{2 \phi_{m/2}(p^{-2}) \prod_{i=1}^{m/2}(1 - p^{-2i}X^{-1}t)} \prod_{i=1}^{m/2}(1 - p^{-1}X^i).
\]
Then by the functional equation of Siegel series we have 
\[ P_m(d, X^{-1}, t) = \chi_{K_p}((-1)^{m/2}d)P_m(d, X, t) \]
for any \( d \in \mathcal{N}_p \). Hence we have 
\[ P_m^{(0)}(X^{-1}, t) = P_m^{(1)}(X, t). \]
Hence the reduced denominator of the rational function \( P_m^{(0)}(X, t) \) in \( t \) is at most 
\[ \prod_{i=1}^{m/2} (1 - p^{-2i+1}X^{-1}t)^{m/2} \prod_{i=1}^{m/2} (1 - p^{-2i}Xt), \]
and similarly to (1) we have 
\[ P_m^{(0)}(X, t) = \frac{1}{2\phi_{m/2}(p^{-2}) \prod_{i=1}^{m/2} (1 - p^{-2i+1}X^{-1}t) \prod_{i=1}^{m/2} (1 - p^{-2i}Xt)}. \]
Similarly 
\[ P_m^{(1)}(X, t) = \frac{1}{2\phi_{m/2}(p^{-2}) \prod_{i=1}^{m/2} (1 - p^{-2i+1}X^{-1}t) \prod_{i=1}^{m/2} (1 - p^{-2i}Xt)}. \]
We have 
\[ P_m(d_0, X, t) = P_m^{(0)}(X, t) + \chi_{K_p}((-1)^{m/2}d_0)P_m^{(1)}(X, t). \]
This proves the assertion.

**Proof of Theorem 4.3.2.** The assertion can also be proved by using the same argument as above. \( \square \)

**Theorem 4.3.6.** Let \( d_0 \in \mathbb{Z}_p^* \).

1. Suppose that \( K_p \) is unramified over \( \mathbb{Q}_p \) or that \( K_p = \mathbb{Q}_p \oplus \mathbb{Q}_p \). Then 
\[ \hat{P}_m(d_0, X, t) = P_m(d_0, X, t) \]
for any \( m > 0 \).

2. Suppose that \( K_p \) is ramified over \( \mathbb{Q}_p \). Then 
\[ \hat{P}_{2n+1}(d_0, X, t) = P_{2n+1}(d_0, X, t) \]
and 
\[ \hat{P}_{2n}(d_0, X, t) = \frac{1}{2\phi_n(p^{-2})} \times \left\{ \prod_{i=1}^{n} (1 - tp^{-2i+1}X^{-1})(1 - tp^{-2i}X) \prod_{i=1}^{n} (1 - tp^{-2i}\chi_K(p)X^{-1})(1 - tp^{-2i+1}\chi_K(p)X) \right\}. \]

**Proof.** The assertion (1) is clear from the definition. We note that \( P_m(d_0, X, t) \) does not depend on the choice of \( \pi \). Suppose that \( K_p \) is ramified over \( \mathbb{Q}_p \). If \( m = 2n + 1 \), then it follows from (3) of Theorem 4.3.2 that we have 
\[ \lambda^*_{m,n}(\pi d_0, X) = \lambda^*_{m,n}(\pi^i, X) \]
for any \( d \in \mathbb{Z}_p^* \), and in particular we have 
\[ \lambda^*_{m,n}(p^\ell d_0, X) = \lambda^*_{m,n}(\pi^i, X). \]
This proves the assertion. Suppose that \( m = 2n \). Write \( \hat{P}_{2n}(d_0, X, t) \) as
\[
\hat{P}_{2n}(d_0, X, t) = \hat{P}_{2n}(d_0, X, t)_{\text{even}} + \hat{P}_{2n}(d_0, X, t)_{\text{odd}},
\]
where
\[
\hat{P}_{2n}(d_0, X, t)_{\text{even}} = \frac{1}{2} \{ \hat{P}_{2n}(d_0, X, t) + \hat{P}_{2n}(d_0, X, -t) \},
\]
and
\[
\hat{P}_{2n}(d_0, X, t)_{\text{odd}} = \frac{1}{2} \{ \hat{P}_{2n}(d_0, X, t) - \hat{P}_{2n}(d_0, X, -t) \}.
\]
We have
\[
\hat{P}_{2n}(d_0, X, t)_{\text{even}} = \sum_{i=0}^{\infty} \lambda_{2n,p}^{2i}(p^{2i}d_0, X, Y)t^{2i} = \sum_{i=0}^{\infty} \lambda_{2n,p}^{2i}(p^{2i}d_0, X, Y)t^{2i}
\]
and
\[
\hat{P}_{2n}(d_0, X, t)_{\text{odd}} = \sum_{i=0}^{\infty} \lambda_{2n,p}^{2i+1}(d_0, X)t^{2i+1} = \sum_{i=0}^{\infty} \lambda_{2n,p}^{2i+1}(p^{2i+1}d_0p^{-1}, X)t^{2i+1}.
\]
Hence we have
\[
\hat{P}_{2n}(d_0, X, t)_{\text{even}} = \frac{1}{2} \{ P_{2n}(d_0, X, t) + P_{2n}(d_0, X, -t) \},
\]
and
\[
\hat{P}_{2n}(d_0, X, t)_{\text{odd}} = \frac{1}{2} \{ P_{2n}(d_0, X, t) - P_{2n}(d_0\pi p^{-1}, X, -t) \},
\]
and hence we have
\[
\hat{P}_{2n}(d_0, X, t) = P_{2n}^{(0)}(d_0, X, t) + \frac{1}{2} (1 + \chi_{K_p}(\pi p^{-1}))\chi_{K_p}((-1)^n d_0)P_{2n}^{(1)}(d_0, X, t) + \frac{1}{2} (1 - \chi_{K_p}(\pi p^{-1}))\chi_{K_p}((-1)^n d_0)P_{2n}^{(1)}(d_0, X, -t).
\]
Assume that \( \chi_{K_p}(\pi p^{-1}) = 1 \). Then \( \chi(d_0\pi p^{-1}) = \chi(d_0) \), and we have
\[
\hat{P}_{2n}(d_0, X, t) = P_{2n}(d_0, X, t).
\]
Suppose that \( \chi_{K_p}(\pi p^{-1}) = -1 \). Then \( \chi(d_0\pi p^{-1}) = -\chi(d_0) \), and we have
\[
\hat{P}_{2n}(d_0, X, t) = P_{2n}^{(0)}(d_0, X, t) + \chi_{K_p}((-1)^n d_0)P_{2n}^{(1)}(d_0, X, -t).
\]
Since \( \pi \in N_{K_p/\mathbb{Q}_p}(K_p^\times) \), we have \( \chi_{K_p}(\pi p^{-1}) = \chi_{K_p}(p) \). This proves the assertion. \( \square \)

**Corollary.** Let \( m = 2n \) be even. Suppose that \( K_p \) is ramified over \( \mathbb{Q}_p \). For \( l = 0, 1 \) put
\[
\hat{P}_{2n}^{(l)}(X, t) = \frac{1}{2} \sum_{d \in \mathcal{N}_{K_p}} \chi_{K_p}((-1)^n d)\hat{P}_{2n}(d, X, t).
\]
Then we have
\[
\hat{P}_{2n}(d, X, t) = \frac{1}{2} (\hat{P}_{2n}^{(0)}(X, t) + \chi_{K_p}((-1)^n d)\hat{P}_{2n}^{(1)}(X, t)),
\]
and
\[
\hat{P}_{2n}^{(0)}(X, t) = P_{2n}^{(0)}(X, t),
\]
and
\[
\hat{P}_{2n}^{(1)}(X, t) = P_{2n}^{(1)}(X, \chi_{K_p}(p)t),
\]
The following result will be used to prove Theorems 2.3 and 2.4.

**Proposition 4.3.7.** Let \( d \in \mathbb{Z}_p^* \). Then we have

\[
\lambda_{m, p}^*(d, X) = u_p \lambda_{m, p}(d, X).
\]

**Proof.** Let \( I \) be the left-hand side of the above equation. Let

\[
GL_m(O_p)_1 = \{U \in GL_m(O_p) \mid \det U \det U = 1\}.
\]

Then there exists a bijection from \( \text{Her}_m(d, O_p)/GL_m(O_p)_1 \) to \( \text{Her}_m(dN_{K_p}/O_p, (O_p^*)_p, O_p)/GL_m(O_p) \). Hence

\[
I = \sum_{A \in \text{Her}_m(d, O_p)/GL_m(O_p)_1} \frac{\tilde{F}_p^{(0)}(A, X)}{\alpha_p(A)}.
\]

Now for \( T \in \text{Her}_m(d, O_p) \), let \( l \) be the number of \( SL_m(O_p) \)-equivalence classes in \( \text{Her}_m(d, O_p) \) which are \( GL_m(O_p) \)-equivalent to \( T \). Then it can easily be shown that \( l = l_{p, T} \). Hence the assertion holds. \( \square \)

5. **Proof of the main theorem**

**Proof of Theorem 2.3.** For a while put \( \lambda_p^*(d) = \lambda_{m, p}^*(d, m^{-1}) \). Then by Theorem 3.4 and Proposition 4.3.7, we have

\[
L(s, I_{2n}(f)) = \mu_{2n,k,D} \sum_d \prod_p (u_p^{-1} \lambda_p^*(d)) d^{-s+k+2n}.
\]

Then by (1) and (2) of Theorem 4.3.1, and (1) of Theorem 4.3.6, \( \lambda_p^*(d) \) depends only on \( p^{\text{ord}_p(d)} \) if \( p \nmid D \). Hence we write \( \lambda_p^*(d) \) as \( \tilde{\lambda}_p(p^{\text{ord}_p(d)}) \). On the other hand, if \( p \mid D \), by (3) of Theorem 4.3. and , (2) of Theorem 4.3.6, \( \lambda_p^*(d) \) can be expressed as

\[
\lambda^*(d) = \lambda_p^{(0)}(d) + \chi_{K_p}((-1)^n d p^{-\text{ord}_p(d)}) \lambda_p^{(1)}(d),
\]

where \( \lambda_p^{(l)}(d) \) is a rational number depending only on \( p^{\text{ord}_p(d)} \) for \( l = 0, 1 \). Hence we write \( \lambda_p^{(l)}(d) \) as \( \tilde{\lambda}_p^{(l)}(p^{\text{ord}_p(d)}) \). Then we have

\[
b_m(f; d) = \sum_{Q \subset Q_D \text{gcd}(d, pD)} \prod_{p \mid d, p \not\mid D} \left( u_p^{-1} \tilde{\lambda}_p(p^{\text{ord}_p(d)}) \prod_{q \in Q} \chi_{K_q}(p^{\text{ord}_p(d)}) \right)
\times \prod_{p \mid d, p \not\mid D, p \not\mid Q} \left( u_p^{-1} \tilde{\lambda}_p^{(0)}(p^{\text{ord}_p(d)}) \prod_{q \in Q} \chi_{K_q}(p^{\text{ord}_p(d)}) \right)
\times \prod_{p \mid d, p \not\mid Q} \left( u_p^{-1} \tilde{\lambda}_p^{(1)}(p^{\text{ord}_p(d)}) \prod_{q \in Q, q \not= p} \chi_{K_q}(p^{\text{ord}_p(d)}) \right) \prod_{q \in Q, q \not= p} \chi_{K_q}((-1)^n))
\]

for a positive integer \( d \). We note that for a subset \( Q \) of \( Q_D \) we have

\[
\chi_Q(m) = \prod_{q \in Q} \chi_{K_q}(m)
\]

for an integer \( m \) coprime to any \( q \in Q \), and

\[
\chi_Q'(p) = \chi_{K_q}(p) \prod_{q \in Q, q \not= p} \chi_{K_q}(p)
\]
for any $p \in Q$. Hence, by Theorems 4.3.1 and 4.3.6, and Corollary to Theorem 4.3.6, we have

$$L(s, I_{2n}(f)) = \mu_{2n,k,D} \sum_{Q \subset Q_D} \prod_{p \mid D} \sum_{i=0}^{\infty} u_p^{-1} \lambda_p^{(0)}(p^i) \chi Q(p^i) p^{(-s+k+2n)i}$$

$$\times \prod_{p \mid D, p \not\equiv Q} \sum_{i=0}^{\infty} u_p^{-1} \lambda_p^{(1)}(p^i) \prod_{q \not\equiv q \in Q} \chi Q(p^i) p^{(-s+k+2n)i}.$$

$$= \mu_{2n,k,D} \sum_{Q \subset Q_D} \chi_Q((-1)^n) \prod_{p \mid D} (u_p^{-1} P_{2n,p}(1, \alpha_p^{-1}, \chi Q(p)^{-s+k+2n})).$$

Now for $l = 0, 1$ write $P_{2n,p}^{(l)}(X, t)$ as

$$P_{2n,p}^{(l)}(X, t) = t^{n_i} P_{2n,p}^{(l)}(X, t),$$

where $i_p = 0$ or $1$ according as $4 \mid D$ or not. Notice that $u_p = (1 - \chi(p)p^{-1})^{-1}$ if $p \nmid D$ and $u_p = 2^{-1}$ if $p \mid D$. Hence we have

$$L(s, I_{2n}(f)) = \mu_{2n,k,D} \sum_{Q \subset Q_D} \chi_Q((-1)^n)$$

$$\times \prod_{p \mid Q_D} p^{(-s+k+2n)n} \left( \prod_{p \mid Q_D, p \not\equiv Q} \chi Q(p) \prod_{p \mid Q_D, q \not\equiv q} \chi Q(p) \right)^n$$

$$\times \prod_{p \mid D} ((1 - \chi(p)p^{-1}) P_{2n,p}(1, \alpha_p^{-1}, \chi Q(p)^{-s+k+2n})).$$

$$\times \prod_{p \mid D, p \not\equiv Q} \left(2 P_{2n,p}^{(0)}(\alpha_p^{-1}, \chi Q(p)^{-s+k+2n}) \prod_{p \mid Q} \left(2 P_{2n,p}^{(1)}(\alpha_p^{-1}, \chi Q(p)^{-s+k+2n}) \right) \right) \prod_{p \mid Q_D} \chi Q(p) \prod_{p \mid Q_D, q \not\equiv q} \chi Q(p).$$

where $Q^c_D = Q_D \setminus \{2\}$ or $Q_D$ according as $4 \mid D$ or not. Note that

$$2^{n((-s+k+2n)n)} \prod_{p \mid Q_D} p^{(-s+k+2n)n} = D^{(-s+k+2n)n},$$

and

$$\prod_{p \mid Q_D, p \not\equiv Q} \chi Q(p) \prod_{p \mid Q_D, q \not\equiv q} \chi Q(p) = 1.$$

Thus the assertion follows from Theorem 4.3.1.

**Proof of Theorem 2.4.** The assertion follows directly from Theorems 3.4 and 4.3.2.
