Supporting Information

Two Perturbations for Geometry Optimization of Off-Lattice Bead Protein Models

Hiroshi Takeuchi*

Division of Chemistry, Graduate School of Science, Hokkaido University,
Sapporo 060-0810, Japan

Supporting Information

Table S1. The global-minimum geometries of the SHH and IPS model proteins.

Figure S1. Stereographic views of the global-minimum configurations of the SHH model proteins.

Figure S2. Stereographic views of the global-minimum configurations of the IPS model proteins.

Figure S3. The principle moments of inertia of 200 low-lying configurations of S13, S20.1 – S20.6, S21, and S34. The I_A , I_B , and I_C values are shown in colors of black, red, and blue, respectively. For the S13 SHH model, only 93 low-lying configurations were obtained.

Figure S4. The bond angles of 200 low-lying configurations of S13, S20.1 – S20.6, S21, and S34. For the S13 SHH model, only 93 low-lying configurations were obtained.

Figure S5. The torsional angles of 200 low-lying configurations of S13, S20.1 – S20.6, S21, and S34. For the S13 SHH model, only 93 low-lying configurations were obtained.

Table S1. The global-minimum geometries of the SHH and IPP model proteins.
