Chemicals and Instrumentation

The starting materials expect for 4-bromo-3',4',5',6'-tetraphenyl-1,1':2',1"-terphenyl (1z), 5,15dibromo-10,20-bis(3,5-dimethylphenyl)porphyrin (**1aa**) (10-bromoanthracen-9and yl)dimesitylborane (1ab) were obtained from commercial suppliers and used as received. $1z^1$, $1aa^{2.3}$ and $1ab^4$ were prepared according to the reported procedures, respectively. Solvents for substrate preparation were purchased from commercial suppliers, and further dried over molecular sieve (MS 4Å). All mechanochemical reactions were carried out using grinding vessels in a Retsch MM400 mill. Both bowls (1.5 mL or 25 mL) and balls are made of stainless. NMR spectra were recorded on JEOL JNM-ECX400P and JNM-ECS400 spectrometers (¹H: 392 or 396 or 399 or 401 MHz, ¹³C: 99 or 100 MHz). Tetramethylsilane (¹H), CDCl₃ (¹³C) was employed as external standards, respectively. Multiplicity was recorded as follows: s = singlet, brs = broad singlet, d = doublet, t = triplet, q = quartet, quint = quintet, sept = septet, o = octet, m = multiplet. Dibromomethane was used as an internal standard to determine NMR yields. GLC analyses were conducted with a Shimazu GC-2014 or GC-2025 equipped with ULBON HR-1 glass capillary column (Shinwa Chemical Industries) and a FID detector. High-resolution mass spectra were recorded at the Global Facility Center, Hokkaido University. MALDI-TOF mass spectra were recorded at the Open Facility Center, Hokkaido University. Powder diffraction data were recorded on a Rigaku SmartLab diffractometer with Cu-K $_{\alpha}$ radiation and D/teX Ultra detector covering 5-60° (2 θ). Thermography was recorded with an NEC Avio Thermo GEAR G120. Transmission electron microscopy (TEM) analysis was carried out at "Joint-Use Facilities: Laboratory of Nano-Micro Material Analysis", Hokkaido University.

General Procedure for Solid-State C-N Coupling Using a Ball Mill

Aryl halide **1** (0.5 mmol), diarylamine **2** (0.5 mmol, 1.0 equiv), $Pd(OAc)_2$ (0.025 mmol, 5 mol %) were placed in a ball milling vessel (stainless, 1.5 mL) loaded with one grinding ball (stainless, diameter: 3 mm). The ball milling vessel was then transferred to a glovebox. In a glovebox, *t*-Bu₃P (0.025 mmol, 5 mol %) and Na(O-*t*-Bu) (0.75 mmol, 1.5 equiv) were placed in the milling vessel. After the milling vessel was removed from glovebox, the vessel was opened under air, then 1,5-cod (0.20 μ L mg⁻¹) was added via syringe. After the vessel was closed in air without the purge with inert gas, the vessel was placed in the ball mill (Retch MM400, 99 min at 30Hz). After 99 min, the mixture was passed through a short silica gel column eluting with EtOAc to remove inorganic salts. The crude mixture was then purified by flash column chromatography (SiO₂, CH₂Cl₂/hexane, typically 0-15:85) to give the corresponding arylamines **3**.

1b (7.0 mmol, 1.970 g), **2c** (7.0 mmol, 1.381 g, 1.0 equiv), $Pd(OAc)_2$ (0.14 mmol, 31.4 mg, 2 mol %) were placed in a ball milling vessel (stainless, 25 mL) loaded with 4 grinding balls (stainless, diameter: 10 mm). The ball milling vessel was then transferred to a glovebox. In a glovebox, *t*-Bu₃P (0.14 mmol, 28.4 mg, 2 mol %) and Na(O-*t*-Bu) (10.5 mmol, 1.010 g, 1.5 equiv) were placed in the milling vessel. After the milling vessel was removed from glovebox, the vessel was opened under air, then 1,5-cod (840 µL, 0.20 µL mg⁻¹) was added quickly. After the vessel was closed without the purge with inert gas, the vessel was placed in the ball mill (Retch MM400, 99 min at 30Hz). After 99 min, the mixture was passed through a short silica gel column eluting with EtOAc to remove inorganic salts. The crude mixture was then purified by reprecipitation from CH₂Cl₂/MeOH to give the arylamine **3c** as a yellow solid (2.567 g, 92% yield).

Reaction Temperature Confirmed by Thermography

The temperature inside the milling jar after the solid-state coupling reaction was confirmed by thermography. The crude mixtures were prepared by the following conditions: 0.5 mmol of **1b**; 0.5 mmol of **2a**; 0.025 mmol of Pd(OAc)₂; 0.025 mmol of ligand; 0.75 mmol of Na(O-*t*-Bu); 1.5-cod (60 μ l) in a stainless-steel ball-milling jar (1.5 mL) with a stainless-steel ball (3 mm); 30 Hz; 60 min. The obtained image showed that the temperature was around 30 °C, indicating that this reaction proceeded at round room temperature.

Characterization of Palladium Nanoparticles by Transmission Electron Microscopy

The crude mixtures were prepared by the following conditions: 0.5 mmol of **1b**; 0.5 mmol of **2a**; 0.025 mmol of Pd(OAc)₂; 0.025 mmol of ligand; 0.75 mmol of Na(O-*t*-Bu); 1,5-cod (62 μ l) or cyclooctane (62 μ l) in a stainless-steel ball-milling jar (1.5 mL) with a stainless-steel ball (3 mm); 30 Hz; 99 min. The samples for the characterization by transmission electron microscopy (TEM) were prepared by dropping the colloidal solution of MeOH onto a copper grid covered with thin carbon film. Additional images of the reaction mixtures upon grinding for 99 min were shown in Supplementary Figure 7–9. The timescales for the aggregation of palladium particles in the reaction mixtures that contain cyclooctane or that are free of additives were shown in Supplementary Figure 10 and 11.
