## Introduction

Terpenes, an important class of naturally occurring hydrocarbons, are generally derived from the five-carbon isoprene units and are present in plants, fungi, bacteria, insects, and so on. Terpinoids, which are further chemically modified derivatives of terpenes, are biologically synthesized from mevalonic acid. Sesquiterpenes, a class of terpenes consisting of three isoprene units, constitute the largest group among this family, and some of them have unique features (Figure 1). For example, Caryophyllene which was isolated from an essential oil of Humulus lupulus possesses a unique bicyclic skeleton involving nine- and four-membered carbocycles. While most of terpenes are obtained as colorless oils or crystals, Guaiazulene is a blue-colored crystalline hydrocarbon.

Guaianulene

Figure 1. Some examples of sesquiterpenes

The complexity in the structure of terpenoids is remarkably increased by conjunction with phenol moieties through biosynthetic processes. This type of secondary metabolites is called meroterpenoids, and they often show intriguing biological activities. For example, Applanatumin $A$ is reported to exhibit potent antifibrotic activity in TGF- $\beta 1$-induced human renal proximal tubular cells (Figure 2). ${ }^{1}$

Figure 2. Structure of Applanatumin A

Psidium guajava L., whose edible fruits are commonly called "guava", is an evergreen shrub of Myrtaceae. The leaves of this plant have been used as a folk medicine in China for the treatment of diarrhea and hyperglycemia, and the medicinal ingredients have attracted much attention from chemists. To date, seventeen meroterpenoids, as typified by Psiguadials, have been isolated from the extract of the leaves by several research groups. These natural products possess characteristic hybrid structures commonly composed of a sesquiterpenoid moiety and two aromatic rings as shown in Figure 3. ${ }^{2}$ Some of them exhibited significant biological activities including inhibitory effects on protein tyrosine phosphatase 1B (PTP1B) and the growth of human hepatoma cell (HepG2).

Among them, Psiguadial B (1), isolated by Shao and co-workers in 2010, was found to exhibit stronger antitumor activity against HepG2 cells ( $\mathrm{IC}_{50}$ : 46 nM ) than others. ${ }^{2 \mathrm{c}}$ Furthermore, Rizzo and co-workers have recently reported that the extract abundantly containing 1 has a physiological activity similar to estradial and tamoxifen, and also in vivo activity against solid Ehrich murine breast adenocarcinoma. ${ }^{3}$

The two aromatic rings of $\mathbf{1}$ are thought to come from Benzoyl-CoA, and the biological precursor of its sesquiterpene substructure is supposed as $\beta$-caryophyllene (Scheme 1).

Scheme 1. Proposal of biosynthetic pathway for Psiguadial B

First, Benzoyl-CoA is combined to polyketide by condensation with one molecule of malonyl-CoA and two molecules of methylmalonyl-CoA. Next, cyclization and enolization of the polyketide could lead to 3,5-dimethyl-2,4,6-trihydroxybenzophenone, which had previously been isolated from the P. guajava. ${ }^{4}$ It is supposed that an acid triggered oxidization and dehydration of the compound produces a carbocation $\mathbf{A}$ which is attacked by the tri-substituted alkene moiety of $\beta$-caryophyllene. The resulting intermediate $\mathbf{B}$ would undergo $\beta$-elimination to form diene $\mathbf{C}$, which undergoes protonation followed by transannular cyclization to form bicycle[4.3.1]decane skeleton. Finally, the phenolic hydroxyl group of the resulting intermediate D would capture the bridgehead cation to afford 1. This plausible biosynthetic route has been studied by examination of a chemical reaction by Tran and co-workers (Scheme 2). ${ }^{5}$ Upon treatment with a catalytic amount of dimethylethylenediamine (DMEDA) at an ambient temperature, the mixture of $\beta$-caryophylene, phloroglucinol, and benzaldehyde produced $\mathbf{1}$ along with other cycloadducts. In this case, cation $\mathbf{A}$ would arise from the reaction of phloroglucinol with benzaldehyde. While the semi total synthesis by Tran is very simple, the products were obtained as a complex mixture of the isomeric compounds.

Scheme 2. Biomimetic synthesis of Psiguadial B by Tran

Recently, Reisman and co-workers reported the first enantioselective total synthesis of $(+)$-Psiguadial B by an entirely different route from the biomimetic synthesis. ${ }^{6}$ Their synthetic strategy was to construct the seven-memberd ring of the tricyclo[6.3.1.0 $0^{2,5}$ dodecane skeleton after connection of the cyclobutane and cyclohexane segments (Scheme 3). First, chiral cyclobutane amide A1 was stereoselectively linked with iodocyclohexenone derivative A2 using Pd-catalyst and silver carbonate through $\mathrm{C}\left(\mathrm{sp}^{3}\right)$-H activation of the cyclobutane moiety to afford A3. Next, ring-closing metathesis of allylic alcohol A5 obtained from introduction of a
vinyl group into cyclohexanone A4 was implemented to form the seven-membered ring, followed by reduction of the two olefins of $\mathbf{A 6}$ under the condition of homogeneous reaction. After copper-catalyzed etherification of A7 progressed to form pyran A8, the total synthesis of $(+) \mathbf{- 1}$ was completed via introductions of a phenyl group at the benzylic position and two formyl groups on the aromatic ring.

Scheme 3. Enantioselective total synthesis of (+)-Psiguadial B by Riesmen and co-workers

On the other hand, the author has developed efficient methods for the synthesis of cycloheptane derivatives by the cyclization reactions or formal cycloaddition reactions of alkyne dicobalt complexes. Herein, the author describes the achievement of the total synthesis of 1 using the novel reactions and methodologies for assembling the unique structure.

## Chapter I

## Construction of Bicyclo[4.3.1]decane Skeleton via

## Double Cyclization Reaction of Alkyne Dicobalt Complex

For achieving the total synthesis of $\mathbf{1}$, it was required to develop an efficient method for the construction of the fused-tricyclic terpene skeleton as well as the stereoselective introduction of the two aromatic rings. Thus, the author carried out the retrosynthetic analysis of $\mathbf{1}$ as depicted in Scheme 4. The two formyl groups on the aromatic ring of 1, that may be sensitive to both reduction and oxidation, are to be introduced at the later stage of the total synthesis. The dimethylcyclobutane 2 would be derived from cyclobutanecarbonitrile 3, the four-membered ring of which would be constructed by an intramolecular cyclization reaction of iodonitrile 4 under basic conditions.

Scheme 4. Retrosynthetic analysis for Psiguadial B

With a view to controlling the stereochemistry at the C2 and C5 positions of 4, maleic anhydride $\mathbf{6}$ was designed as the key intermediate of the total synthesis. Thus, the corresponding maleate may undergo the stereoselective conjugate reduction, giving rise to trans-diester 5. The hydrobenzopyran moiety of $\mathbf{6}$ is to be formed by a formal cycloaddition reaction of bicyclo[4.3.1]decane segment 7 with phloroglucinol derivative 8. The author planned to utilize the novel transformation of an acetylene-dicobalt complex into a maleic anhydride mediated by ammonium cerium(IV) nitrate (CAN), which was originally reported by Tanino et al. ${ }^{7}$ Therefore, cobalt complex 9 possessing a bicyclic carbon framework was set as the target molecule at this point.

For developing an efficient method for the construction of the bicyclo[4.3.1]decane skeleton of $\mathbf{9}$, the author designed a new cascade reaction of acetylene-dicobalt complex $\mathbf{1 0}$ having an allylsilane moiety and two leaving groups (Scheme 5). ${ }^{8}$ On treatment with a suitable metal chloride $\left(\mathrm{LMCl}_{\mathrm{n}}\right)$ which acts as a Lewis acid, cobalt complex $\mathbf{1 0}$ would undergo the first cyclization reaction through cationic species $\mathbf{E}$. This type of C-C bond formation which proceeds through a hexacarbonyl dicobalt-propargyl cation intermediate is well known as the "Nicholas reaction". Since the cyclization product possesses a methoxyl group at the propargyl position and an electron rich alkene moiety, the second cyclization reaction may occur through the cationic intermediate $\mathbf{F}$. The resulting cationic species $\mathbf{G}$ would be captured by a chloride ion, giving rise to the desired bicyclo[4.3.1]decane derivative 9 with a chloride moiety at the bridgehead position.

Scheme 5. Design of cascade cyclization reaction for constructing the bicyclo[4.3.1]decane skeleton

Initially, the author attempted the preliminary experiments on the second cyclization step of the cascade reaction, and model substrate 16 was synthesized in 4 steps as depicted in Scheme 6. Cuprate 11, which was generated by the successive treatment of methyl propargyl ether with butyllithium and copper(I) thiocyanate, ${ }^{9}$ was reacted with 3-methyl-2-cyclohexen-1-one (12) in the presence of tert-butyldimethylsilyl trifluoromethanesulfonate (TBSOTf). The resulting enol silyl ether $\mathbf{1 3}$ was treated with tetrabutylammonium fluoride to afford ketone 14 which in turn was subjected to the Wittig reaction, giving rise to alkene 15 . The complexation of 15 with dicobalt octacarbonyl yielded the cyclization precursor 16 which was expected to undergo a cyclization reaction to form a bicyclo[4.3.1]decane skeleton.

Scheme 6. Synthesis of model substrate 16

With the model substrate in hand, the cyclization reactions were investigated under the influence of several Lewis acids. It is known that the use of boron or aluminum reagents such as boron trifluoride etherate or ethylaluminum dichloride is suitable for the Nicholas reactions, while acetylene dicobalt complexes tend to undergo decomposition in the presence of titanium(IV) chloride. It is also noteworthy that the Lewis acidity of an aluminum reagent is readily tunable by choosing suitable substituents on the aluminum atom. The results of the cyclization reaction of $\mathbf{1 6}$ with aluminum reagents are shown in Table $1 .{ }^{10}$ The initial attempt using ethylaluminum dichloride effected the desired cyclization reaction, but the product was found to be 18 possessing an ethyl group at the bridgehead position (entry 1). The result led the author to replace the ethyl group of ethylaluminum chloride by the treatment with tert-butyl alcohol or phenols. Indeed, the reaction with ${ }^{t} \mathrm{BuOAlCl}_{2}$ afforded the desired chloride $\mathbf{1 7}$, albeit in low yield (entry 2). Aluminum phenoxides generally exhibit higher Lewis acidity than aluminum alkoxides, and the use of phenoxyaluminum dichloride led to formation of $\mathbf{1 7}$ in $42 \%$ yield (entry 3). After several examinations, the use of aluminum reagent derived from 2,4-dichlorophenol was found to give 17 in the highest $60 \%$ yield (entry 5), while the use of Lewis acids with higher acidity were not so effective (entries 6 and 7).

Table 1. Examination of Lewis acid for seven-membered ring formation

These preliminary results encouraged the author to undertake the synthesis of the substrate of the cascade double cyclization reaction (Scheme 7). Starting with commercially available lactone 19, lactone 21 which appeared in literature ${ }^{11}$ was synthesized through the aldol condensation with benzaldehyde and hydrogenation of the resulting $\alpha$-benzylidenlactone $\mathbf{2 0}$. The ring opening reaction mediated with $\mathrm{Me}(\mathrm{MeO}) \mathrm{NMgCl}$ followed by oxidation of the resulting secondary alcohol afforded ketoamide 22. Successive treatment of $\mathbf{2 2}$ with lithium acetylide of methyl propargyl ether followed by TMSCl and DMAP gave amide $\mathbf{2 3}$ which was reacted with MeLi to yield ketone 24 . The allylsilane moiety for the intramolecular cyclization reaction was constructed by the Pd catalyzed cross-coupling reaction of enol triflate 25 with (trimethylsilyl)methylmagnesium chloride. After acetylation of the resulting alcohol 26, the complexation with dicobalt octacarbonyl gave the cyclization precursor 28.

Scheme 7. Synthesis of acetylene dicobalt complex 28

Subsequently, cobalt complex 28 was subjected to the double cyclization reaction mediated by 2,4-dichlorophenoxyaluminum dichloride which was found as the best reagent in the previous model study. As shown in Table 2, the equivalent of the aluminum reagent was found to influence the chemical yield of the desired product 9 . Thus, the use of 1.5 equiv. of the aluminum reagent led to formation of a $1: 1$ mixture of the bicyclic compound 9 and monocyclic compound 29 (entry 1 ), but the use of an increased amount ( 2.2 equiv.) of the aluminum reagent gave a satisfactory result (entry 2 ). On the other hand, the reaction promoted by an excess amount ( 5.0 equiv.) of the Lewis acid resulted in formation of new compound $\mathbf{3 0}$ instead of the desired product 9 (entry 3). The five-membered carbocycle of $\mathbf{3 0}$ would be formed by the intramolecular Friedel-Crafts reaction of the bridgehead cation. These results indicated that the cascade cyclization reaction of $\mathbf{2 8}$ proceeds through the cationic intermediates that are in equilibrium with the corresponding chlorides, and the use of an excess amount of Lewis acid facilitates the next cyclization step.

Table 2. Double cyclization reaction of 28

excess Lewis acid

The double cyclization reaction proceeded in highly stereoselective manner, and the configuration of product 9 was determined after conversion to the corresponding maleic anhydride 32. The benzyl group was found to be oriented to the concave side of the bicyclic skeleton by the NOE experiments, the relationship between the protons in which was displayed in Scheme 8.

Scheme 8. Transformation into maleic anhydride 32

Judging from the relative stereochemistry between the benzyl group and the bridgehead carbon atoms of the bicyclic skeleton, the monocyclic intermediate $\mathbf{3 1}$ should possess the benzyl group and the cobalt complex moiety cis to each other (Scheme 9). This stereochemical relationship is formed in the first cyclization step of cationic species $\mathbf{H}$, and it should be noted that a simple chair-like transition state model in which the bulky substituents occupy the equatorial positions is not consistent with the results. Therefore, alternative chair-like transition state model, in which the cobalt complex moiety is directed to the axial position, was considered on the basis of the secondary orbital interaction (SOI). Thus, SOI between the bonding $\sigma$ orbital on the C (allylic)-Si bond and the antibonding $\pi^{*}$ orbital in the LUMO side would contribute to stabilize the transition state leading to the syn product 31. ${ }^{12,13}$

Scheme 9. Contribution of SOI (dotted line) in the transition state

With the key bicyclic compound in hand, the stage was set for the construction of the hydrobenzopyran structure via a Friedel-Crafts reaction (Scheme 10). Upon heating with AIBN and NBS, maleic anhydride 32 underwent selective bromination at the benzylic position, and the resulting bromide 33 was converted to acetate 34 by the reaction with silver acetate. The Friedel-Crafts reaction of $\mathbf{3 4}$ with phloroglucinol derivative 35 was attempted under the influence of boron trifluoride etherate, giving rise to hydrobenzopyran derivative 36 in $65 \%$ yield. This formal cycloaddition approach to the core skeleton of the natural product $\mathbf{1}$ seemed attractive, but the product was obtained as an inseparable $1: 1$ mixture of epimers at the C 1 ' position. Treatment of the diastereomeric mixture of 36a and 36b with (trimethylsilyl)diazomethane in methanol afforded a separable mixture of diester 37 and its epimer, the stereochemistry of which was determined by the X-ray crystallographic analysis.

X-ray structure of 37

Scheme 10. Formation of benzopyron 36 by intermolecular Friedel-Crafts reaction

Next, the author focused on the stereocontrolled construction of the hydrobenzopyran ring by a stepwise strategy, that is, formation of an ether bond at the bridgehead position followed by the intramolecular Friedel-Crafts alkylation reaction (Scheme 11). Chloride 9 was reacted with 3,5-dimethoxyphenol under the influence of $\mathrm{AgBF}_{4}$ to afford aromatic ether $\mathbf{3 8}$ the cobalt complex moiety of which was converted to maleic anhydride by the oxidation with CAN. The resulting compound 39 was subjected to benzylic bromination with NBS and AIBN, giving rise to dibromide 40 . Surprisingly, the crude dibromide 40 underwent a cyclization reaction during the silica gel chromatography to yield hydrobenzopyran derivative 41 as a single diastereomer. The stereochemistry of $\mathbf{4 1}$ was supposed to be consistent with that of natural compound 1 , because of the similar coupling constants between $\mathrm{H}\left(\mathrm{C} 1^{\prime}\right)$ and $\mathrm{H}(\mathrm{C} 9)$ in both $\mathbf{4 1}$ and compound 37.

Scheme 11. Synthesis of benzopyran 41 by intramolecular Friedel-Crafts reaction

The intramolecular Friedel-Crafts reaction would proceed through a six-membered chair-like transition state I in Scheme 12. The steric repulsion between the phenyl group of the benzyl cation moiety and the bicyclic core skeleton would fix the conformation of the transition state, and the substituted aromatic ring attacks the cationic center to form the hydrobenzopyran ring possessing the C 1 ' phenyl group at the equatorial position.

Scheme 12. Chair-like transition state (TS) of the intramolecular Friedel-Crafts reaction

In conclusion, the author succeeded in developing a new method for constructing the complex polycyclic skeleton of Psiguadial B (1). The terpenoid substructure of $\mathbf{1}$ was constructed on the basis of a cascade double cyclization reaction of an acetylene dicobalt complex, which afforded the bicyclo[4.3.1]decane derivative with a benzyl group with correct configuration. The substituted aromatic ring was introduced to the bridgehead position of the intermediate, and bromination under radical conditions followed by intramolecular cyclization reaction resulted in formation of the benzopyran moiety in a stereoselective manner. The remaining task, namely, the construction of the dimethylcyclobutane moiety and functionalization of the aromatic ring are described in the next chapter.

## Experimental Section

## General Information

All the reactions were carried out in a round-bottomed flask with an appropriate number of necks and side arms connected to a three-way stopcock and/or a rubber septum cap under an argon atmosphere. All vessels were first evacuated by a rotary pump and then flushed with argon prior to use. Solutions and solvents were introduced by a hypodermic syringe through a rubber septum. During the reaction, the vessel was kept under a positive pressure of argon. Dry THF was freshly prepared by distillation from benzophenone ketyl before use. Anhydrous solvents were purchased from Kanto Chemical Co. Inc. Infrared (IR) spectra were recorded on a JASCO FT/IR-4100 spectrophotometer by attenuated total reflection (ATR). Wavelength of maximum absorbance are quoted in $\mathrm{cm}^{-1} .1 \mathrm{H}-\mathrm{NMR}$ spectra were recorded on a JEOL ECA-500 ( 500 MHz ) in $\mathrm{CDCl}_{3}$. Chemical shifts are reported in part per million ( ppm ), and signal are expressed as singlet (s), doublet (d), triplet (t), quartet ( $q$ ), multiplet (m), broad (br). ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectra were recorded on a JEOL ECA-500 $(125 \mathrm{MHz})$ in $\mathrm{CDCl}_{3}$. Chemical shifts are reported in part per million (ppm). High resolution mass (HRMS) spectra were recorded on a JEOL JMS AX-500, JEOL JMS-SX102A or JEOL JMS-T-100GCV at the S1GC-MS \& NMR Laboratory, Graduate School of Agriculture, Hokkaido University. Analytical thin layer chromatography (TLC) was performed using 0.25 mm E. Merck Silica gel ( $60 \mathrm{~F}-254$ ) plates. Reaction components were visualized by illumination with ultraviolet light ( 254 nm ) and by staining with $8 \%$ ethanolic phosphomolybdic acid, or ceric ammonium molybdate in $10 \%$ sulfuric acid. Kanto Chem. Co. Silica Gel 60 N (particle size $0.040-0.050 \mathrm{~mm}$ ) was used for column chromatography.

Compound 20 : To a solution of the $\delta$-hexanolactone $19(4.70 \mathrm{~g}, 44.3 \mathrm{mmol})$ and benzaldehyde $(9.65 \mathrm{~mL}, 66.4 \mathrm{mmol})$ in toluene $(90 \mathrm{~mL})$ was added $\mathrm{NaOMe}(4.07 \mathrm{~g}, 75.3 \mathrm{mmol})$ in small portion at $-10{ }^{\circ} \mathrm{C}$ for 1 h under argon atmosphere. Then the reaction was stirred at room temperature for 2 h , and was quenched with EtOAc ( 70 mL ) and a $10 \%$ sulfuric acid solution $(70 \mathrm{~mL})$. After the mixture was neutralized with a saturated aqueous $\mathrm{NaHCO}_{3}$ solution, the organic layer was extracted with EtOAc. The combined organic layers were dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure. The resulting solid was washed with Heaxane- ${ }^{i} \mathrm{Pr}_{2} \mathrm{O}$ (3:1) to give 6.44 g of $\mathbf{2 0}(74 \%$ ) as a white solid: IR (ATR) v 3431, 2966, 2931, 1637, 1495, $1454,1389,1176,1128,985,732,700 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 6.83(\mathrm{~s}, 1 \mathrm{H}), 6.81(\mathrm{~s}$, $1 \mathrm{H}), 4.92(\mathrm{t}, J=4.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.44(\mathrm{q}, J=5.1,1 \mathrm{H}), 3.33(\mathrm{~s}, 1 \mathrm{H}), 2.67(\mathrm{ddd}, J=13.7,4.6,1.1 \mathrm{~Hz}$, $1 \mathrm{H}), 2.36$ (ddd, $J=12.0,6.3,1.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.34(\mathrm{~s}, 1 \mathrm{H}), 2.31(\mathrm{~s}, 1 \mathrm{H}), 2.26(\mathrm{~d}, J=13.7 \mathrm{~Hz}, 1 \mathrm{H})$, $1.85(\mathrm{~d}, J=12.0 \mathrm{~Hz}, 1 \mathrm{H}), 1.47(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.43(\mathrm{~s}, 3 \mathrm{H}), 1.19(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 125 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 206.69,177.55,168.97,149.47,149.35,138.18,126.43,122.13,121.36,74.44$, 58.37, 46.15, 45.49, 41.85, 40.34, 39.69, 29.65, 21.20, 21.10, 19.21, 18.50; HRMS (EI): Calcd for (M+) C21H24O5: 356.1624; found: 356.1620.

Compound 21 : To a solution of $20(3.03 \mathrm{~g}, 14.5 \mathrm{mmol})$ in EtOH ( 50 mL ) was added $10 \% \mathrm{Pd} / \mathrm{C}$ $(150 \mathrm{mg}, 5 \mathrm{wt} \%)$, then the reaction was stirred at room temperature for 2.5 h under hydrogen atmosphere. After the reaction mixture was filtrated through a pad of celite, the filtrate was concentrated under reduced pressure. The crude product was purified by silica gel columm chromatography (Hexane : $\mathrm{AcOEt}=3: 1$ ) to give 2.96 g of 21 (quant.) as a white solid: m.p. $68-70{ }^{\circ} \mathrm{C}$; IR (ATR) v 3431, 2966, 2931, 1637, 1495, 1454, 1389, 1176, 1128, 985, 732, 700 $\mathrm{cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.32-7.28(2 \mathrm{H}, \mathrm{m}), 7.24-7.19(3 \mathrm{H}, \mathrm{m}), 4.46-4.42(0.6 \mathrm{H}, \mathrm{m})$, 4.36-4.33 ( $0.4 \mathrm{H}, \mathrm{m}$ ), 3.41 ( 0.4 H , dd, $J=13.7,4.0 \mathrm{~Hz}$ ), $3.35(0.6 \mathrm{H}, \mathrm{dd}, J=13.7,4.0 \mathrm{~Hz}), 2.80$ $(0.4 \mathrm{H}, \mathrm{dd}, J=13.7,9.7 \mathrm{~Hz}), 2.76-2.70(0.6 \mathrm{H}, \mathrm{m}), 2.66-2.59(1 \mathrm{H}, \mathrm{m}), 1.92-1.79(2 \mathrm{H}, \mathrm{m})$,

Compound 22 : To a suspension of $21(6.00 \mathrm{~g}, 29.4 \mathrm{mmol})$ and $\mathrm{Me}(\mathrm{MeO}) \mathrm{NH} \cdot \mathrm{HCl}$ in THF ( 150 $\mathrm{mL})$ was slowly added ${ }^{i} \mathrm{PrMgCl}\left(2.0 \mathrm{M}\right.$ in $\left.\mathrm{Et}_{2} \mathrm{O}, 66.0 \mathrm{~mL}, 132 \mathrm{mmol}\right)$ at $-50^{\circ} \mathrm{C}$, then stirred at 0 ${ }^{\circ} \mathrm{C}$ for 30 min under argon atmosphere. After the reaction mixture was quenched with a saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution, the organic layer was extracted with EtOAc. The combined organic layers were dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure. The crude $\mathbf{S 1}$ $(8.19 \mathrm{~g})$ was used for next step without further purification.

To a suspension of $\mathbf{S 1}(8.75 \mathrm{~g}, 29.4 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(21.2 \mathrm{~mL}, 147 \mathrm{mmol})$ in DMSO ( 60 $\mathrm{mL})$ was added $\mathrm{SO}_{3} \cdot \mathrm{Py}(11.7 \mathrm{~g}, 73.5 \mathrm{mmol})$ in small portion, then stirred at room temperature for 1.5 h under argon atmosphere. After the reaction mixture was quenched with a saturated aqueous $\mathrm{NaHCO}_{3}$ solution, the organic layer was extracted with Hexane-EtOAc (1:1). The combined organic layers were dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure. The crude product was purified by silica gel columm chromatography (Hexane : $\mathrm{AcOEt}=1: 1 \rightarrow 1: 2$ ) to give 8.19 g of $\mathbf{2 2}$ (quant.) as a yellow oil: IR (ATR) v 2932, 1713, 1651, 1453, 1419, 1388, 1366, 1173, 987, 751, $701 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.27-7.24(2 \mathrm{H}, \mathrm{m}), 7.19-7.17$ $(3 \mathrm{H}, \mathrm{m}), 3.30(3 \mathrm{H}, \mathrm{s}), 3.18-3.11(1 \mathrm{H}, \mathrm{m}), 3.11(3 \mathrm{H}, \mathrm{s}), 2.99(1 \mathrm{H}, \mathrm{dd}, J=13.2,9.2 \mathrm{~Hz}), 2.66(1 \mathrm{H}$, dd, $J=13.2,9.2 \mathrm{~Hz}$ ), 2.43-2.35 ( $2 \mathrm{H}, \mathrm{m}$ ), $2.09(3 \mathrm{H}, \mathrm{s}), 1.89-1.85(2 \mathrm{H}, \mathrm{m}) ;{ }^{13} \mathrm{C}$ NMR ( 125 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 208.08,175.69,139.70,139.85,128.95,128.22,126.15,61.06,42.17,40.74,38.66$, 31.82, 29.74, 26.16; HRMS ( $\mathrm{FI}^{+}$): Calcd for $\left(\mathrm{M}^{+}\right) \mathrm{C}_{15} \mathrm{H}_{21} \mathrm{NO}_{3}$ : 263.1521; found: 263.1514.

22

Compound 23 : To a solution of methyl propargyl ether ( $3.72 \mathrm{~mL}, 44.1 \mathrm{mmol}$ ) in THF ( 75 mL ) was slowly added ${ }^{n} \mathrm{BuLi}(2.6 \mathrm{M}$ in Hexane, $14.4 \mathrm{~mL}, 38.2 \mathrm{mmol})$ at $-78^{\circ} \mathrm{C}$, then stirred at room temperature for 20 min under argon atmosphere. A solution of 22 ( $8.18 \mathrm{~g}, 29.4 \mathrm{mmol}$ ) in THF $(75 \mathrm{~mL})$ was added dropwise to the reaction mixture at $-78^{\circ} \mathrm{C}$, then stirred at $-60^{\circ} \mathrm{C}$ for 30 min . TMSCl ( $5.57 \mathrm{~mL}, 44.1 \mathrm{mmol}$ ) and DMAP ( $718 \mathrm{mg}, 5.88 \mathrm{mmol}$ ) was added to the mixture at -78 ${ }^{\circ} \mathrm{C}$, then stirred at room temperature for 3 h . After the reaction mixture was quenched with a saturated aqueous $\mathrm{NaHCO}_{3}$ solution, the organic layer was extracted with EtOAc. The combined organic layers were dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure. The crude product was through a short pad of silica gel to give 11.5 g of $\mathbf{2 3}(96 \%)$ as a pale yellow oil: IR (ATR) v 2955, 2934, 1658, 1454, 1248, 1172, 1102, 1051, 1024, 985, 902, 753, $700 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR (500 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta$ 7.26-7.24 (2H, m), 7.19-7.15 (3H, m), $4.11(0.8 \mathrm{H}, \mathrm{s}), 4.10(1.2 \mathrm{H}, \mathrm{s})$, $3.36(1.2 \mathrm{H}, \mathrm{s}), 3.35(1.8 \mathrm{H}, \mathrm{s}), 3.32(3 \mathrm{H}, \mathrm{s}), 3.13-2.97(1 \mathrm{H}, \mathrm{m}), 3.10(3 \mathrm{H}, \mathrm{s}), 2.99(1 \mathrm{H}, \mathrm{dd}, J=$ $13.2,9.2 \mathrm{~Hz}), 2.71-2.69(1 \mathrm{H}, \mathrm{m}), 1.91-1.81(1 \mathrm{H}, \mathrm{m}), 1.76-1.58(3 \mathrm{H}, \mathrm{m}), 1.44(3 \mathrm{H}, \mathrm{s}), 0.16(9 \mathrm{H}$, s); ${ }^{13} \mathrm{C} \operatorname{NMR}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 176.29,140.26,129.10,128.23,126.10,90.49,90.15,80.15$, $79.81,77.26,77.21,77.00,76.75,69.29,69.13,61.12,59.91,57.50,43.33,42.56,42.42,38.84$, $38.54,31.97,31.16,30.93,29.68,27.67,27.45,2.06,1.83,1.59 ; \mathrm{HRMS}_{\left(\mathrm{FD}^{+}\right): \text {Calcd for }\left(\mathrm{M}^{+}\right)}$ $\mathrm{C}_{22} \mathrm{H}_{35} \mathrm{NO}_{4} \mathrm{Si}$ : 405.2335 ; found: 405.2329 .

Compound 24 : To a solution of $23(11.4 \mathrm{~g}, 28.1 \mathrm{mmol})$ in THF ( 140 mL ) was slowly added $\mathrm{MeLi}\left(1.1 \mathrm{M}\right.$ in $\left.\mathrm{Et}_{2} \mathrm{O}, 37.3 \mathrm{~mL}, 42.2 \mathrm{mmol}\right)$ at $-78^{\circ} \mathrm{C}$, then stirred at $-70^{\circ} \mathrm{C}$ for 20 min under argon atmosphere. After the reaction mixture was quenched with a saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution, the organic layer was extracted with EtOAc. The combined organic layers were dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure. The crude product was through a short pad of silica gel to give 9.50 g of 24 (94\%) as a pale yellow oil: IR (ATR) v 2953, 2932, 2359, $1712,1454,1356,1248,1167,1102,839,753,699 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ 7.27-7.24 (2H, m), 7.19-7.14 (3H, m), $4.10(0.8 \mathrm{H}, \mathrm{s}), 4.09(1.2 \mathrm{H}, \mathrm{s}), 3.344(1.2 \mathrm{H}, \mathrm{s}), 3.336$ $(1.8 \mathrm{H}, \mathrm{s}), 2.92-2.88(1 \mathrm{H}, \mathrm{m}), 2.82(1 \mathrm{H}$, sextet, $J=6.3 \mathrm{~Hz}), 2.71-2.66(1 \mathrm{H}, \mathrm{m}), 2.01(3 \mathrm{H}, \mathrm{s})$, 1.84-1.51 (4H, m), $1.43(3 \mathrm{H}, \mathrm{s}), 0.16(9 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 212.01,211.89$, $139.51,139.47,128.79,128.35,126.16,90.06,89.88,80.21,80.07,69.07,68.96,59.78,57.44$, $54.42,54.35,42.10,42.03,37.65,37.39,31.13,30.97,29.89,29.65,26.43,26.24,1.74$; HRMS

## Accomplishment of Total Synthesis of Psiguadial B: Stereocontrolled Construction of the Cyclobutane Moiety

Having achieved the stereoselective synthesis of $\mathbf{4 1}$ as the key intermediate of Psiguadial B(1), the stage was set for the construction of the dimethylcyclobutane moiety. Considering the stereochemistry of the C2 and C5 positions at which the four-membered ring is fused with the bicyclo[4.3.1]decane skeleton, the author planned to transform maleic anhydride 41 into diester $(2 \beta, 5 \alpha)-5$ (Scheme 13).

Scheme 13. Plan for transformation of 41 into 5

Upon treatment with samarium(II) iodide in THF, maleic anhydride 41 underwent the conjugate reduction to afford cis-fused acid anhydride $(2 \alpha, 5 \alpha)-42$ as a single diastereomer (Scheme 14). The $\beta$-configuration of the two hydrogen atoms at the C 2 and C 5 positions was confirmed by the observation of NOEs, and the result can be explained by the stereoselective protonation of the bisenolate intermediate, which is generated through the two-electron reduction of $\mathbf{4 1}$, from the convex face of the bicyclo[4.3.1]decane skeleton.

Scheme 14. Conjugate reduction of 41 with $\mathrm{SmI}_{2}$

Acid anhydride 42 was converted to the corresponding diester $(2 \alpha, 5 \alpha)-43$ by the reaction with (trimethylsilyl)diazomethane in methanol, and the epimerization of the ester moiety was examined under the influence of sodium methoxide (Scheme 15). While the desired compound was $(2 \beta, 5 \alpha)-47$, the NOE experiment of the product indicated that the configuration of the C 2 and C5 positions was $\alpha$ and $\beta$, respectively. The stereochemical outcome suggested that only the sterically less hindered C5-ester group could undergo enolization followed by protonation, giving rise to $(2 \alpha, 5 \beta)-44$.

Scheme 15. Epimerization of 43 under basic conditions

On the other hand, conversion of maleic anhydride 41 to the corresponding diester 45 prior to the reduction with samarium(II) iodide led to different stereoselectivity, and diester $(2 \beta, 5 \beta)-46$ was obtained (Scheme 16). It was found that the stereoselectivity in the reduction of maleate 45 depends on the quenching method of the intermediate. Thus, the use of isopropanol followed by aqueous sodium bicarbonate solution gave the best result.

Scheme 16. Stereoselective reduction of $\mathbf{4 5}$ with $\mathrm{SmI}_{2}$

The remarkable stereoselectivity in the reduction of maleate 45 can be rationalized as shown in Scheme 17. The configuration of the C2 and C5 positions are controlled at the protonation step of the bisenolate intermediate $\mathbf{J}$ which is produced through the two-electron reduction of maleate $\mathbf{4 5}$. Since bisenolate $\mathbf{J}$ has the fully substituted conjugated diene structure, the two enolate moiety of the stable conformer would be in staggered relationship to each other as depicted in the figure. The first protonation of $\mathbf{J}$ would occur at the less hindered C5 enolate moiety from the $\alpha$-face, because the $\beta$-face is covered with the C 2 enolate moiety. The resulting C 2 enolate $\mathbf{K}$ would be protonated mainly from the opposite face of the C 5 ester group to afford diester $(2 \beta, 5 \beta)-46$ along with the minor epimer $(2 \alpha, 5 \beta)-44$ which is generated by the protonation from the convex face of the bicyclic skeleton.

Scheme 17. Plausible mechanism on reduction of $\mathbf{4 5}$ using $\mathrm{SmI}_{2}$ to provide 46

Similarly with the case of diester $(2 \alpha, 5 \alpha)-43$, diester $(2 \beta, 5 \beta)-46$ underwent epimerization mediated by sodium methoxide only at the less hindered C5 position, giving rise to the desired diester (2 $2 \beta, 5 \alpha$ )-47 (Scheme 18). Confirmation of the stereochemistry of the C 2 and C 5 positions was performed by the NOE experiment.

Scheme 18. Epimetization of 46

The desired intermediate $(2 \beta, 5 \alpha)-47$ in hand, the stage was set for the synthesis of $\delta$-iodonitrile 50 as the substrate of the intramolecular $\mathrm{S}_{\mathrm{N}} 2$ reaction for constructing the four-membered ring (Scheme 19). Reduction of ( $2 \beta, 5 \alpha$ )-47 with DIBAL-H yielded 1,4-diol 48 which was further converted to diiodide 49 through mesylation followed by a substitution reaction with sodium iodide. The initial attempts for converting the less hindered C 4 iodide moiety to the corresponding nitrile by the reaction with sodium cyanide resulted in formation of a mixture of iodonitrile $\mathbf{5 0}$, its regioisomer 51, and dinitrile 52.

Scheme 19. Attempt on conversion from diester 47 into $\delta$-iodonitrile 50

With a view to reducing the reactivity at the C 3 position, the author planned to use cyclic sulfonate 53, which was readily obtained from 1,4-diol 48 by known method, ${ }^{14}$ instead of diiodide 49 (Scheme 20). Upon heating with potassium cyanide in NMP, 53 underwent the regioselective substitution reaction at the C 4 position, and the resulting monosulfate was treated with diluted sulfonic acid to give the desired cyano alcohol 54. After conversion to iodonitrile 55, construction of the four-membered ring and methylation of the resulting nitrile was performed by the reaction with an excess amount of lithium diethylamide followed by methyl iodide. The one-pot procedure afforded nitrile 56 in $77 \%$ yield which was transformed into the dimethylcyclobutane derivative 59 through DIBAL-H reduction to aldehyde 57, sodium borohydride reduction to the corresponding alcohol, tosylation of the alcohol, and reduction of tosylate 58 with lithium triethylborohydride. ${ }^{15}$

Scheme 20. Construction of dimethylcyclobutane 59

The author also explored an improved transformation of the intermediate aldehyde 57 into 59 by using Wolff-Kishner reduction (Table 3). The initial attempt of heating aldehyde 57 with hydrazine hydrate and potassium hydroxide failed to give the desired product $\mathbf{5 9}$ in good yield (entry 1), because a fair amount of demethylated product $\mathbf{6 0}$ was formed under violent reaction conditions. The alternative route involving the formation and reduction of the corresponding tosylhydrazone with $\mathrm{NaBH}_{3}(\mathrm{CN})^{16}$ also led to unsatisfying yield (entry 2). Finally, the Wolff-Kishner reduction mediated by potassium tert-butoxide in dimethyl sulfoxide ${ }^{17}$ gave $\mathbf{5 9}$ along with a debrominated derivative 59' in moderate combined yield (entry 3 ).

Table 3. Wolff-Kishner reduction of aldehyde 57

Debrominated compound 59' was also obtained by the treatment of 59 with tert-butyllithium followed by protonation with water. Since $\mathbf{5 9}^{\prime}$ was found to give better crystals which are suitable for the X-ray crystallographic analysis, the structure of the synthetic compound was confirmed at this point. The Ortep drawing indicated that the configuration of $\mathbf{5 9}^{\prime}$ is consistent with that of the natural product (Scheme 21).

Scheme 21. Confirmation of the stereochemistries by X-ray analysis

The remaining task toward the total synthesis is the introduction of the functional groups on the substituted aromatic ring. The mixture of $\mathbf{5 9}$ and $59^{\prime}$ was converted to dibromide 61 by the treatment with NBS, and the installation of two formyl groups at once was explored (Scheme 22). However, successive treatment of aryl dibromide 61 with tert-butyllithium and dimethylformamide failed to give the desired dialdehyde. Another approach by a carbonylation reaction promoted by a palladium catalyst also resulted in recovery of the substrate.

Scheme 22. Attempt on direct installation of two formyl groups to diromide 61

On the other hand, the corresponding diester $\mathbf{6 3}$ was found to be obtainable, albeit in moderate yield, through the reaction of dibromide $\mathbf{6 1}$ with tert-butyllithium followed by methyl chloroformate (Scheme 23). Diester 63 could be converted to dialdehyde $\mathbf{6 2}$ by DIBAL-H reduction and PDC oxidation, but the low yield of these transformation was not suitable for accomplishing efficient total synthesis. The use of dinitrile 67 , which was obtained by the reaction of dibromide $\mathbf{6 1}$ with copper(I) cyanide, suffered from the low reactivity toward the DIBAL-H reduction.

Scheme 23. Other studies on conversion into 62

Finally, the author succeeded in transforming dibromide 61 into the desired dialdehyde 62 as depicted in Scheme 24. Thus, dibromide 61 was subjected to the Suzuki-Miyaura coupling reaction with vinylboronic anhydride pyridine complex to give divinyl compound $\mathbf{6 8}{ }^{18}$ The oxidative cleavage of the vinyl groups was accomplished by the combined use of catalytic amount of osmium(VIII) oxide and sodium periodate in the presence of 2,6-lutidine. ${ }^{19}$ The resulting dialdehyde 62 was subjected to removal of the methyl ether groups by heating with lithium chloride, ${ }^{20}$ giving rise to Psiguadial B in good yield.

Scheme 24. Total synthesis of Psiguadial B (1)

Figure 4 shows the comparison of the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of reference data ${ }^{2 b}$ and synthetic compound 1. It was found that the spectrum of the synthetic natural product is precisely consistent with that of the reference data.

(a) the natural compound reported by Ye et al. ${ }^{2 b}$
(b) the final product synthesized by the author

In conclusion, the author has accomplished the total synthesis of Psiguadial B starting from the key compound 41 . The stereochemistry of the C 2 and C 5 positions, at which the four-membered ring is fused with the bicyclo[4.3.1]decane skeleton, was controlled by the conjugate reduction of maleate 45 followed by epimerization to afford diester 47. After constructing the four-membered ring by an intramolecular alkylation reaction of iodonitrile, the introduction of the two formyl groups via the corresponding divinyl compound afforded the natural compound 1.

## Experimental Section

Compound 43 : To a solution of $39(312 \mathrm{mg}, 0.675 \mathrm{mmol})$ in $\mathrm{CCl}_{4}(13 \mathrm{~mL})$ were added NBS $(240 \mathrm{mg}, 1.35 \mathrm{mmol})$ and $\operatorname{AIBN}(111 \mathrm{mg}, 0.675 \mathrm{mmol})$ at room temperature, then the reaction mixture was heated instantly and refluxed for 1 h under argon atmosphere. After cooling, silica gel (ca. 1 g ) and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$ were added to the mixture at $0{ }^{\circ} \mathrm{C}$ and stirred at room temperature for 10 min . The filtrate was concentrated under reduced pressure, and the crude product was through a short pad of silica gel to give 41 containing impurities.

To a solution of $\mathbf{4 1}$ in THF ( 8.0 mL ) was added $\operatorname{SmI}_{2}(0.1 \mathrm{M}$ in THF, $16.3 \mathrm{~mL}, 1.63$ mmol ) at $-78^{\circ} \mathrm{C}$ under argon atmosphere, and then the mixture was stirred for 40 min . After the reaction mixture was quenched with $\mathrm{AcOH}-\mathrm{THF}(1: 1,1.6 \mathrm{~mL})$ and warmed to room temperature, the organic layer was extracted with AcOEt . The combined organic layers were dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure. The crude product was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(8 \mathrm{~mL})$ and $\mathrm{MeOH}(8 \mathrm{~mL})$. To the solution, $\mathrm{TMSCHN}_{2}\left(2.0 \mathrm{M} \mathrm{in}^{2} \mathrm{Et}_{2} \mathrm{O}, 1.6 \mathrm{~mL}, 3.26\right.$ mmol ) was added, and then the mixture was stirred at room temperature for 1.5 h under argon atmosphere. After the solvent was removed under reduced pressure, the residue was purified by silica gel columm chromatography (Hexane : $\mathrm{AcOEt}=4: 1 \rightarrow 2: 1$ ) to give 246 mg of 43 as a white solid ( $62 \%$ from 39) : ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.21-7.18(2 \mathrm{H}, \mathrm{m}), 7.14-7.12(1 \mathrm{H}, \mathrm{m})$, 7.07-7.03 ( $2 \mathrm{H}, \mathrm{m}$ ), $6.02(1 \mathrm{H}, \mathrm{s}), 3.85(3 \mathrm{H}, \mathrm{s}), 3.66(3 \mathrm{H}, \mathrm{s}), 3.65(3 \mathrm{H}, \mathrm{s}), 3.62(1 \mathrm{H}, \mathrm{d}, J=12.0$ $\mathrm{Hz}), 3.29(1 \mathrm{H}, \mathrm{d}, J=5.2 \mathrm{~Hz}), 3.25(3 \mathrm{H}, \mathrm{s}), 2.82-2.79(1 \mathrm{H}, \mathrm{m}), 2.54-2.34(4 \mathrm{H}, \mathrm{m}), 1.84-1.78(1 \mathrm{H}$, m), $1.74-1.72(1 \mathrm{H}, \mathrm{m}), 1.55-1.52(1 \mathrm{H}, \mathrm{m}), 1.49-1.35(3 \mathrm{H}, \mathrm{m}), 1.32(3 \mathrm{H}, \mathrm{s}), 1.08(1 \mathrm{H}, \mathrm{td}, J=$ $13.9,4.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 174.62,174.31,157.81,155.99,152.07,145.76$, $127.67,125.54,110.20,92.36,90.19,79.79,56.18,55.43,53.34,52.14,51.13,49.88,48.42$,
 586.1566; found: 586.1551.

Compound 44 : To a solution of $43(227 \mathrm{mg}, 0.386 \mathrm{mmol})$ in $\mathrm{THF}(4 \mathrm{~mL})$ and $\mathrm{MeOH}(4 \mathrm{~mL})$ was added $\mathrm{NaOMe}(209 \mathrm{mg}, 3.86 \mathrm{mmol})$ at $0^{\circ} \mathrm{C}$. The reaction mixture was refluxed for 2 h , and was quenched with a saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution at $0{ }^{\circ} \mathrm{C}$. After the organic layer was extracted with AcOEt , the combined organic layers were dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. The crude product was purified by silica gel columm chromatography (Hexane : AcOEt $=$ $4: 1 \rightarrow 3: 1)$ to give 136 mg of 44 as a white solid ( $60 \%$ ): ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.22-7.19(2 \mathrm{H}$, m), 7.16-7.13 ( $1 \mathrm{H}, \mathrm{m}$ ), 7.05-7.04 ( $2 \mathrm{H}, \mathrm{m}$ ), $6.02(1 \mathrm{H}, \mathrm{s}), 3.85(3 \mathrm{H}, \mathrm{s}), 3.643(3 \mathrm{H}, \mathrm{s}), 3.639(3 \mathrm{H}, \mathrm{s})$, $3.59(1 \mathrm{H}, \mathrm{d}, J=10.9 \mathrm{~Hz}), 3.27(3 \mathrm{H}, \mathrm{s}), 2.98(1 \mathrm{H}, \mathrm{t}, J=10.9 \mathrm{~Hz}), 2.69(1 \mathrm{H}, \mathrm{d}, J=12.0 \mathrm{~Hz}), 2.53(1 \mathrm{H}$, d, $J=13.7 \mathrm{~Hz}), 2.07-1.78(5 \mathrm{H}, \mathrm{m}), 1.72-1.63(3 \mathrm{H}, \mathrm{m}), 1.38-1.30(1 \mathrm{H}, \mathrm{m}), 1.11(3 \mathrm{H}, \mathrm{s}), 0.97(1 \mathrm{H}, \mathrm{td}$, $J=14.3,5.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 175.72,174.42,157.84,155.96,151.63,145.56$, $127.98,125.63,110.79,93.01,90.33,79.76,58.33,56.19,55.42,52.01,51.45,50.21,47.56,47.40$, $41.30,36.33,34.96,33.70,33.12,27.35,25.17$; HRMS ( $\mathrm{FD}^{+}$): Calcd for $\left(\mathrm{M}^{+}\right) \mathrm{C}_{30} \mathrm{H}_{35} \mathrm{BrO}_{7}$ : 586.1566; found: 586.1551.

Compound 45 : To a solution of $41(1.40 \mathrm{~g}, 1.88 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ and $\mathrm{MeOH}(10 \mathrm{~mL})$ was added $\mathrm{TMSCHN}_{2}\left(2.0 \mathrm{M}\right.$ in $\left.\mathrm{Et}_{2} \mathrm{O}, 4.70 \mathrm{~mL}, 9.40 \mathrm{mmol}\right)$ and stirred at room temperature for 4 h under argon atmosphere. After the solvent was removed under reduced pressure, the residue was through a short pad of silica gel to give 1.38 g of $\mathbf{4 5}$ containing impurities.

Compound 46 : To a solution of $41(1.38 \mathrm{~g}, 1.88 \mathrm{mmol})$ in THF $(19 \mathrm{~mL})$ was added $\mathrm{SmI}_{2}(0.1$ M in THF, $47 \mathrm{~mL}, 4.70 \mathrm{mmol}$ ) at $-78^{\circ} \mathrm{C}$ under argon atmosphere, and stirred for 1 h . After the reaction mixture was quenched with isopropanol followed by a saturated aqueous $\mathrm{NaHCO}_{3}$ solution, the organic layer was extracted with AcOEt. The combined organic layers were dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure. The crude product was purified by silica gel columm chromatography (Hexane : $\mathrm{AcOEt}=20: 1 \rightarrow 9: 1$ ) to give 1.11 g of 46 as a white solid: m.p. 237-239 ${ }^{\circ} \mathrm{C}$; IR (ATR) v 2944, 1732, 1598, 1568, 1454, 1434, 1407, 1344, 1206, $1162,1117,1096,754,701 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.22-7.19(2 \mathrm{H}, \mathrm{m}), 7.16-7.13$ $(1 \mathrm{H}, \mathrm{m}), 7.06-7.01(2 \mathrm{H}, \mathrm{m}), 6.01(1 \mathrm{H}, \mathrm{s}), 3.85(3 \mathrm{H}, \mathrm{s}), 3.69(3 \mathrm{H}, \mathrm{s}), 3.65(3 \mathrm{H}, \mathrm{s}), 3.53(1 \mathrm{H}, \mathrm{d}, J$ $=10.9 \mathrm{~Hz}), 3.25(3 \mathrm{H}, \mathrm{s}), 3.17(1 \mathrm{H}, \mathrm{d}, J=13.2 \mathrm{~Hz}), 2.94(1 \mathrm{H}, \mathrm{br}), 2.81(1 \mathrm{H}, \mathrm{d}, J=4.0 \mathrm{~Hz}), 2.55$ $(1 \mathrm{H}, \mathrm{br}), 1.84-1.67(6 \mathrm{H}, \mathrm{m}), 1.45(1 \mathrm{H}, \mathrm{d}, J=14.3 \mathrm{~Hz}), 1.37(1 \mathrm{H}, \mathrm{q}, J=13.7 \mathrm{~Hz}), 1.27-1.20(1 \mathrm{H}$, m), $1.04(3 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 175.19,173.45,157.76,156.06,151.67,145.71$, $127.77,125.63,110.68,93.26,90.35,80.03,56.21,55.45,51.91,51.32,49.96,45.34,45.05$, 43.23, 41.68, 39.70, 36.53, 31.03, 25.69, 25.64, 22.27; HRMS (FD ${ }^{+}$: Calcd for $\left(\mathrm{M}^{+}\right)$ $\mathrm{C}_{30} \mathrm{H}_{35} \mathrm{BrO}_{7}$ : 586.1566; found: 586.1592.

Compound 56 : To a solution of $\mathbf{5 5}(190 \mathrm{mg}, 0.292 \mathrm{mmol})$ in THF $(13 \mathrm{~mL})$ was slowly added $\mathrm{LiNEt}_{2}(0.5 \mathrm{M}$ in THF, $1.3 \mathrm{~mL}, 0.653 \mathrm{mmol})$ at $-78^{\circ} \mathrm{C}$ under argon atmosphere, and stirred for 3 $\min$. After MeI $(162 \mu \mathrm{~L}, 2.61 \mathrm{mmol})$ was added at the same temperature, the reaction mixture was warmed to $0{ }^{\circ} \mathrm{C}$. The mixture was quenched with a saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution, and the organic layer was extracted with AcOEt. The combined organic layers were dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure. The crude product was purified by silica gel columm chromatography (Hexane : $\mathrm{AcOEt}=6: 1 \rightarrow 4: 1$ ) to give 121 mg of 56 as a white solid (77\%): m.p. $258^{\circ} \mathrm{C}$ (dec.); IR (ATR) v 3021, 2932, 2871, 1724, 1598, 1567, 1454, 1435, 1405, $1347,1211,1144,1114,1095,752,701 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.23-7.20(2 \mathrm{H}, \mathrm{m})$, 7.15-7.13 (1H, m), 7.06-7.01 (2H, m), $6.01(1 \mathrm{H}, \mathrm{s}), 3.85(3 \mathrm{H}, \mathrm{s}), 3.48(1 \mathrm{H}, \mathrm{d}, J=11.5 \mathrm{~Hz}), 3.22$ $(3 \mathrm{H}, \mathrm{s}), 2.67-2.62(1 \mathrm{H}, \mathrm{m}), 2.38(1 \mathrm{H}, \mathrm{q}, J=8.6 \mathrm{~Hz}), 2.15(1 \mathrm{H}, \mathrm{t}, J=10.3 \mathrm{~Hz}), 2.06(1 \mathrm{H}, \mathrm{d}, J=$ $13.2 \mathrm{~Hz}), 1.91-1.82(2 \mathrm{H}, \mathrm{m}), 1.72(2 \mathrm{H}, \mathrm{qd}, J=13.2,3.5 \mathrm{~Hz}), 1.65-1.62(1 \mathrm{H}, \mathrm{m}), 1.57-1.52(2 \mathrm{H}$, m), 1.48-1.35 (3H, m), $1.40(3 \mathrm{H}, \mathrm{s}), 1.08(1 \mathrm{H}, \mathrm{td}, J=13.2,4.6 \mathrm{~Hz}), 0.90(3 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}$ NMR ( 125 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 157.80,156.10,151.36,145.73,127.75,125.57,124.83,110.53,93.02,90.29$, 80.52, 56.18, 55.42, 50.19, 47.21, 42.60, 41.96, 38.17, 37.34, 34.32, 33.30, 29.46, 27.96, 25.72, 23.93, 19.83, 16.65; HRMS ( $\mathrm{FD}^{+}$): Calcd for $\left(\mathrm{M}^{+}\right) \mathrm{C}_{30} \mathrm{H}_{34} \mathrm{BrNO}_{3}$ : 535.1722; found: 535.1739.

Compound 59: To a solution of $56(51.2 \mathrm{mg}, 0.0954 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{~mL})$ was slowly added DIBAL-H (1.02 M in Hexane, $93.6 \mu \mathrm{~L}, 0.0954 \mathrm{mmol})$ at $-50^{\circ} \mathrm{C}$ under argon atmosphere, and stirred at $-20^{\circ} \mathrm{C}$ for 20 min . After being quenched with a saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution, the mixture was stirred vigorously at room temperature for 30 min . A saturated aqueous Rochell's solution was then added, and the mixture was stirred vigorously at room temperature for 30 min . The organic layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, and the combined organic layers were dried over $\mathrm{MgSO}_{4}$. After the solution was concentrated under reduced pressure, the crude product $57(50.5 \mathrm{mg})$ was used for next step without further purification.

To a solution of $57(50.5 \mathrm{mg}, 0.0954 \mathrm{mmol})$ in $\mathrm{EtOH}(1.5 \mathrm{~mL})$ and THF $(1.5 \mathrm{~mL})$ was added $\mathrm{H}_{2} \mathrm{NNH}_{2} \cdot \mathrm{H}_{2} \mathrm{O}(93 \mu \mathrm{~L}, 1.91 \mathrm{mmol})$ in one shot at $0^{\circ} \mathrm{C}$, and stirred at room temperature for 1 h under argon atmosphere. After azeotropic removal of the solvent with toluene, the resulting crude hydrazone was dissolved in DMSO ( 1 mL ) and added to a solution of $\mathrm{KO}^{t} \mathrm{Bu}(161 \mathrm{mg}$,
$1.43 \mathrm{mmol})$ in DMSO ( 1 mL ) dropwise over 1.5 h at room temperature under argon atmosphere. The reaction mixture was then stirred for several hours until generation of nitrogen disappeared, and quenched with a saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution. The organic layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, and the combined organic layers were dried over $\mathrm{MgSO}_{4}$. After concentrated under reduced pressure, the crude product was purified by silica gel columm chromatography (Hexane : $\mathrm{AcOEt}=9: 1$ ) to give 27.2 mg of $\mathbf{5 9}$ with a small amount of the debrominated product as a white solid ( $54 \%$ from 56): m.p. $230^{\circ} \mathrm{C}$ (dec.); IR (ATR) v 2955, 2921, 2865, 1727, 1595, $1565,1456,1406,1349,1274,1208,1144,1114,1096,929,703 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( 500 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta$ 7.22-7.19 ( $2 \mathrm{H}, \mathrm{m}$ ), 7.14-7.12 ( $1 \mathrm{H}, \mathrm{m}$ ), 7.06-7.01 $(2 \mathrm{H}, \mathrm{m}), 6.00(1 \mathrm{H}, \mathrm{s}), 3.84(3 \mathrm{H}, \mathrm{s})$, $3.50(1 \mathrm{H}, \mathrm{d}, J=11.5 \mathrm{~Hz}), 3.22(3 \mathrm{H}, \mathrm{s}), 2.17-2.10(2 \mathrm{H}, \mathrm{m}), 1.86-1.75(2 \mathrm{H}, \mathrm{m}), 1.72-1.68(2 \mathrm{H}, \mathrm{m})$, $1.54-1.45(4 \mathrm{H}, \mathrm{m}), 1.36-1.24(4 \mathrm{H}, \mathrm{m}), 1.06-1.01(1 \mathrm{H}, \mathrm{m}), 0.99(3 \mathrm{H}, \mathrm{s}), 0.98(3 \mathrm{H}, \mathrm{s}), 0.84(3 \mathrm{H}$, s); ${ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 157.81,155.94,151.79,146.15,127.66,125.40,110.95$, 93.04, $90.09,81.53,56.16,55.41,50.43,47.69,44.16,42.10,37.78,36.99,35.47,34.96,33.28$, 30.61, 28.26, 26.13, 24.09, 20.74, 20.06; HRMS ( $\mathrm{FD}^{+}$): Calcd for ( $\mathrm{M}^{+}$) $\mathrm{C}_{30} \mathrm{H}_{37} \mathrm{BrO}_{3}$ : 524.1926; found: 524.1938.

Compound 61 : To a solution of $59(23.1 \mathrm{mg}, 0.0488 \mathrm{mmol})$ in THF $(1.0 \mathrm{~mL})$ and $\mathrm{MeCN}(0.25$ mL ) was added NBS ( $17.4 \mathrm{mg}, 0.0976 \mathrm{mmol}$ ) at $0{ }^{\circ} \mathrm{C}$, and stirred at room temperature for 1 h under argon atmosphere. After the reaction mixture was quenched with a saturated aqueous $\mathrm{NaHCO}_{3}$ solution and a saturated aqueous $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ solution, the organic layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The combined organic layers were dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure. The crude product was purified by silica gel columm chromatography (Hexane : $\mathrm{AcOEt}=20: 1$ ) to give 25.4 mg of $\mathbf{6 1}$ as a white solid ( $86 \%$ ): m.p. $102-108{ }^{\circ} \mathrm{C}$; IR (ATR) v 2935, 2865, 1568, 1541, 1453, 1393, 1342, 1198, 1143, 1087, 988, 973, 941, $701 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.28-7.25(2 \mathrm{H}, \mathrm{m}), 7.20-7.17(1 \mathrm{H}, \mathrm{m}), 7.13-7.04(2 \mathrm{H}, \mathrm{m}), 3.87$ $(3 \mathrm{H}, \mathrm{s}), 3.57(1 \mathrm{H}, \mathrm{d}, J=11.5 \mathrm{~Hz}), 3.08(3 \mathrm{H}, \mathrm{s}), 2.14-2.09(2 \mathrm{H}, \mathrm{m}), 1.88-1.81(1 \mathrm{H}, \mathrm{m}), 1.75-1.64$ $(3 \mathrm{H}, \mathrm{m}), 1.49-1.42(4 \mathrm{H}, \mathrm{m}), 1.38-1.28(4 \mathrm{H}, \mathrm{m}), 1.05-1.01(1 \mathrm{H}, \mathrm{m}), 0.994(3 \mathrm{H}, \mathrm{s}), 0.988(3 \mathrm{H}, \mathrm{s})$, $0.85(3 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 156.01,154.28,151.35,144.98,128.23$ (2C), 126.26, 119.92, 103.97, 103.77, 81.89, 60.52, 59.59, 50.48, 47.56, 44.08, 42.85, 37.68, 36.94,

## Conclusion

The author has accomplished the total synthesis of Psiguadial B (1), a meroterpenoid isolated from Psidium guajava L. While the bioactivities of $\mathbf{1}$ including an antitumor activity and a physiological activity have attracted much attention from organic chemists, its complex polycyclic structure required the use of new synthetic methods for achieving the total synthesis.

In chapter I, the author has developed a cascade double cyclization reaction of an acetylenedicobalt complex, which afforded the bicyclo[4.3.1]decane derivative with a benzyl group with correct configuration. The substituted aromatic ring was introduced to the bridgehead position of the intermediate, and bromination under radical conditions followed by intramolecular cyclization reaction resulted in formation of the benzopyran moiety in a stereoselective manner. The resulting compound possesses the polycyclic core skeleton of $\mathbf{1}$.

In chapter II, a practical method for constructing the dimethylcyclobutane moiety was developed through conjugate reduction of a maleate ester. The configuration of C2 and C5 positions, at which the four-membered ring is fused with the bicyclo[4.3.1]decane skeleton, was controlled by stereoselective reduction with samarium(II) iodide followed by epimerization. Dimethylcyclobutane moiety of $\mathbf{1}$ was constructed via intramolecular cyclization reaction of $\delta$-iodonitrile. After functionalization of the aromatic ring, the total synthesis of $\mathbf{1}$ was accomplished in 27 -step-transformation from $\delta$-hexanolactone in $2.2 \%$ overall yield.

## Acknowledgement

All the studies described in this thesis were carried out under the supervision of Professor Dr. Keiji TANINO, Department of Chemistry, Faculty of Science, Hokkaido University. The author would like to express deeply sincere appreciation to Professor Tanino for his guidance and constant encouragement throughout the course of this work, in the preparation of this thesis, and or helpful discussions.

The author expresses his sincere thanks to Professor Dr. Kosuke NAMBA, Department of Pharmaceutical Science, Faculty of Pharmaceutical Sciences, The University of Tokushima, Associate Professor Dr. Takahiro SUZUKI and Assistant Professor Dr. Fumihiko YOSHIMURA, Department of Chemistry, Faculty of Science, Hokkaido University, for practical advice and fruitful discussion.

The author wishes to thanks sincerely Professor Dr. Takanori SUZUKI, Professor Dr. Hideaki OIKAWA, Department of Chemistry, Faculty of Science, Hokkaido University, and Professor Dr. Hajime ITO, Division of Chemical Process Engineering, Graduate School of Engineering, Hokkaido University for serving my dissertation committee.

The author expresses his sincere thanks to Representative Director, President and Chief Executive Officer, Mitsutomo MIYASHITA, Kyorin Pharmaceutical Co.,Ltd., for allowing the author to implement this study.

The author would like to express special thanks to Dr. Yasushi KOHNO, Intellectual Property, KYORIN Holdings, Inc., and Dr. Yasuo TAKANO, Watarase Research Center, Kyorin Pharmaceutical Co., Ltd., for their helpful discussions, guidance and encouragement.

The author is grateful to Dr. Ryohei UEMATSU, for his helpful discussions and encouragement.

The author would like to thank Associate Professor Dr. Jun HARADA for the X-ray crystal-structure analysis.

The author also wishes to thank all the members of the laboratory for their helpful discussions and encouragement.

Finally, the author sincerely thanks to my parents, Mr. Akimasa KINEBUCHI and Mrs. Setsuko KINEBUCHI for their kindness and encouragement.
