24 Abstract

25 The effect of vitamin K on bovine endometrial epithelial cells has not been thoroughly investigated. 26 The objective of this study was to examine the effect of the biologically active form of vitamin K, 27 menaquinone-4, on gene expression in bovine endometrial epithelial cells. First, we examined the 28 mRNA and protein expression levels of UBIAD1, a menaquinone-4 biosynthetic enzyme. Second, we 29 screened for potential target genes of menaquinone-4 in bovine endometrial epithelial cells using RNA-30 sequencing. We found 50 differentially expressed genes; 42 were upregulated, and 8 were 31 downregulated. Among them, a dose-dependent response to menaquinone-4 was observed for the top 32 three upregulated (TRIB3, IL6, and TNFAIP3) and downregulated (CDC6, ORC1, and RRM2) genes. It 33 has been suggested that these genes play important roles in reproductive events. In addition, GDF15 34 and VEGFA, which are important for cellular functions as they are commonly involved in pathways, 35 such as positive regulation of cell communication, cell differentiation, and positive regulation of MAPK 36 cascade, were upregulated in endometrial epithelial cells by menaquinone-4 treatment. To the best of 37 our knowledge, this is the first study showing the expression of UBIAD1 in the bovine uterus. Moreover, 38 the study determined menaquinone-4 target genes in bovine endometrial epithelial cells, which may 39 positively affect pregnancy with alteration of gene expression in cattle uterus.

43

44 **1. Introduction**

Vitamin K (VK) plays essential roles in the blood coagulation system [1]. The VK family consists of VK1 (phylloquinone), VK2 (menaquinones, MKs), and VK3 (menadione). Vitamin K1 is found in plants, VK2 refers to a group of MKs characterized by different side-chain lengths, and VK3 is either chemically synthesized or an intermediate of MK-4 synthesis. The various forms of MKs are named MK-n, where "n" refers to the number of isoprenoid residues in the side chain [2]. Dietary VK1 is endogenously converted to MK-4 [3, 4], which is the most common form of short-chain MK and the functional VK2 in animal tissues [5, 6]. Long-chain MKs (MK-5 to MK-13) are synthesized by bacteria
[2]. The presence of MK-4 in various body tissues suggests that it plays physiological roles. In addition
to blood coagulation, VKs are involved in several processes, including bone metabolism, cell
proliferation, and anti-inflammation [7–11].

To date, extensive studies have been conducted on vitamins A, D, and E because of their frequent deficiency in dairy cows [12, 13]. However, few studies have evaluated VK and its functions. In cows, VK2 is synthesized by rumen microbes to meet nutritional requirements. We recently showed that MK-4 positively influences the activation of peripheral blood mononuclear cells and potentially activates immune functions in dairy cows [14]. Therefore, examination of VK functions in specific tissues may be significant for understanding the physiological roles of VKs in ruminants.

61 In MK-4 biosynthesis, the phytyl and prenyl groups of VK1 and VK2 dissociate from the 62 naphthoquinone ring to form VK3, with no side-chain structures. Then, geranylgeranyl diphosphate 63 (derived from the mevalonate pathway) is covalently bound to VK3 by the prenyltransferase enzyme, 64 UbiA prenyltransferase domain-containing 1 (UBIAD1), to produce MK-4 [4, 15]. UBIAD1 expression is detected in multiple organs, including the mouse uterus [4]. In mice, VK1 and VK3 play a role in 65 66 uterine myometrial contraction [16, 17]. Zhang et al. [16] found that VK3 reduced the effectiveness of 67 prostaglandin F2a-induced uterine contraction; thus, VK3 may be a promising therapeutic strategy for myometrial contractile complications, such as implantation failure, dysmenorrhea, and preterm birth. 68 69 Similarly, VK1 attenuated oxytocin-induced uterine contractions and may contribute to the 70 management and treatment of reproductive disorders [17]. On the other hand, to the best of our 71 knowledge, UBIAD1 expression and the effects of MKs have not yet been studied in mammalian 72 endometrial epithelial cells, including ruminants.

The endometrium epithelial cells play a wide range of important roles such as the prevention of microbes, production of growth factors/cytokines, and reception of embryos. In this study, we hypothesized that if UBIAD1 is expressed in the bovine endometrium, the produced MK-4 may play a role in this tissue. VKs play roles in a wide range of biological processes beyond blood coagulation; therefore, identifying their target genes is critical for a better understanding of their organization. Thus, 78 we aimed to reveal the UBIAD1 expression in bovine endometrial epithelial cells and examine the 79 effects of the biologically active form of VK, MK-4, on gene expression. Our findings may reveal 80 changes in gene expression caused by MK-4 and provide insights into the regulation of the intrauterine 81 environment.

82

83 **2. Materials and Methods**

84 **2.1. Collection of bovine endometrial tissues**

85 Uterine tissues of non-pregnant healthy Holstein cows (approximately 30 to 100 month old) 86 were obtained from a local slaughterhouse (Hokkaido Hayakita Meat Inspection Center, Hokkaido, 87 Japan; and Nichiro Chikusan Co., Ltd., Hokkaido, Japan). The collection of bovine endometrial tissues 88 has been described previously [18]. Briefly, endometrial tissues of the intercaruncular area were 89 dissected from the uterine horn, ipsilateral to the corpus luteum, and cut into small pieces $(3 \times 3 \text{ mm})$. 90 The collected endometrial tissues were classified into early, mid, and late estrous stages, according to 91 the luteal stages (n = 8/stage), to examine UBIAD1 expression. For cell culture, tissue samples were 92 used for cell culture experiments at random without distinguishing the stages. The tissue used were; 93 early luteal phase, n = 4; middle luteal phase, n = 2; late luteal phase, n = 4.

94

95

96 2.2. Culturing of bovine endometrial epithelial cells

The culturing method of bovine endometrial epithelial cells from uterine tissues has been described previously [19]. Briefly, the epithelial cells were cultured in Dulbecco's modified Eagle's medium (DMEM; Wako, Osaka, Japan) supplemented with 5% (v/v) fetal bovine serum (FBS; BioWest, Funakoshi Co., Ltd., Tokyo, Japan) and antibiotic-antimycotic solution (Thermo Fisher Scientific, Waltham, MA, USA) at 38.5 °C with 5% CO₂. The cells were used within ten passages. Human endometrial epithelial cell line HHUA [20] and OMC9 [21] were obtained from Riken Cell Bank (Tsukuba, Japan) and cultured in DMEM with 10% FBS.

104

105 **2.3. Preparation and treatment of MK-4**

106 Cells were cultured on 60-mm collagen-coated dishes (IWAKI AGC TECHNO GLASS Co. Ltd., Shizuoka, Japan) for RNA extraction. Menaquinone-4 (Wako) was dissolved in 99.5% (v/v) 107 108 ethanol (10 mM) as a stock solution and diluted with the culture medium. The cells were cultured in 109 DMEM containing 5% FBS and an antibiotic-antimycotic solution with MK-4 (1, 10, 50, or 100 μ M) or without (cultured medium only, as the control, or 1% ethanol, as the vehicle control; equivalent 110 111 amount of ethanol to the 100 μ M MK-4 treatment). The cells were cultured for 12, 24, and 48 h under 112 a humidified atmosphere of 5% CO₂ at 38.5 °C. Two dishes of samples from each group (control or 113 MK-4 treatment) were used for analysis. Ten independent experiments (replicates) were conducted.

114 Cell proliferation assays were conducted using the Cell Counting Kit-8 (Dojindo, Kumamoto, 115 Japan) according to the manufacturer's instructions. Due to the lack of knowledge of MK-4 116 concentration in bovine uterine tissue, multiple concentrations were examined based on the findings 117 from previous in vitro cell culture systems [22, 23]. To confirm the absence of toxicity caused by the 118 MK-4 treatment, cell proliferation at multiple concentrations (1, 10, 50, or 100 μ M) was examined at the 48 h time point. The cells were seeded onto a 96-well plate (1.0 \times 10⁴ cells/well/200 µL) for 119 120 proliferation assays. The stimulated index (SI) was calculated as the ratio of the average absorbance 121 value from three wells containing MK-4-treated cells relative to that from three wells containing non-122 treated cells. Ten independent experiments were conducted.

123

124 **2.4. RNA extraction and analysis**

Total RNA was extracted from endometrial epithelial tissue pieces $(3 \times 3 \text{ mm})$ (from the UBIAD1 detection experiment in 2.1) or endometrial epithelial cells (from the MK-4 treatment experiment in 2.3) using NucleoSpin RNA Plus (Takara Bio Ltd., Shiga, Japan) according to the manufacturer's protocol. For quantitative real-time PCR (qPCR) analysis, the total RNA isolated (500 ng) was reverse transcribed to cDNA using the ReverTra Ace qPCR RT Master Mix with gDNA Remover (Toyobo, Osaka, Japan). The cDNA reaction mixture was diluted with molecular biologygrade water five times, and 1 µL was taken for each amplification reaction. Target gene expression

levels were determined by qPCR using a LightCycler 96 (Roche Diagnostics, Basel, Switzerland) and 132 THUNDERBIRDTM SYBR qPCR Mix (Toyobo) with 0.5 µM (final concentration) of the primers listed 133 134 in Table 1. The thermal cycling conditions were as follows: 1 cycle at 95 °C for 30 s, followed by 50 cycles at 95 °C for 10 s, 60 °C for 15 s, and 72 °C for 30 s. Relative mRNA abundance was calculated 135 based on the expression levels of bovine H2AFZ, which was used as a reference gene as it shows stable 136 expression in the bovine endometrium [24, 25], and it was relatively stable under MK-4 treatment in 137 138 our preliminary observations. Each run was completed with a melting curve analysis to confirm specific 139 amplification and no primer dimer formation. All experiments were performed following the guidelines 140 of Minimum Information for Publication of Quantitative Real-Time PCR Experiments [26].

141

142 **2.5. RNA-sequencing and data analysis**

143 In the preliminary examination, 1 to 100 μ M of MK-4 did not show significant toxicity 144 (Supplementary Figure 1); thus, the MK-4 treatment for RNA-sequencing was performed at a maximum 145 concentration of 100 µM. Total RNA was extracted from bovine endometrial epithelial cells with or 146 without MK-4 treatment (100 μ M for 48 h; n = 4 per group) using NucleoSpin RNA Plus (Takara Bio 147 UK Ltd., Shiga, Japan). Genome-Lead Corporation (Kagawa, Japan) performed library construction 148 and RNA-sequencing-, to whom we sent 100 μ L of RNA solution adjusted to 30 ng/ μ L for analysis. Libraries were constructed using KAPA mRNA Capture Kit (Roche) and MGIEasy RNA Directional 149 150 Library Prep Set (MGI). Sequencing was performed in 150-bp paired-end format on a DNBSEQ-151 G400RS system. Sequencing reads were mapped to the bovine genome (ARS-UCD1.2) using HISAT2 152 [2527]. The data analyses were based on clean data using iDEP [28]. All RNA-sequencing data were 153 deposited in the DDBJ data bank (https://www.ddbj.nig.ac.jp) (accession number: DRA014943).

154

155 **2.6. Western blotting**

156 To detect the UBIAD1 protein, endometrial lysates were prepared in 157 Radioimmunoprecipitation assay (RIPA) buffer (Wako). The lysates were separated by 10% SDS-158 PAGE and transferred onto a polyvinylidene difluoride (PVDF) membrane using an iBlot Gel Transfer 159 Device system (Invitrogen). After blocking with PVDF blocking buffer (CanGetSignal, Toyobo), the 160 membranes were treated with a rabbit polyclonal anti-UBIAD1 antibody (ab191691, Abcam, 1 µg/mL) or mouse monoclonal anti-beta actin (ACTB) antibody (internal control, 66009-1-Ig, Proteintech, IL, 161 USA, 1:5000), for 1 h at room temperature. Blotting was performed independently for each antibody 162 163 using the same sample (n = 3 for each antibody). Proteins were detected using the following two secondary antibodies: (1) Amersham ECL Anti-rabbit IgG, Horseradish peroxidase-Linked Species-164 165 Specific Whole Antibody (from donkey), or (2) Amersham ECL Anti-Mouse IgG, Horseradish 166 peroxidase-Linked Species-Specific Whole Antibody (from sheep), and EzWestLumi Plus (ATTO). 167 Protein bands were visualized using a chemiluminescence analyzer (LumiCube, Liponics Inc., Tokyo, 168 Japan), and the band intensities were quantified using ImageJ software (ImageJ 1.53k, NIH, Bethesda, 169 MD, USA).

170

171 **2.7. Immunocytochemistry**

Immunohistochemical analyses were performed on 10-μm frozen sections of bovine uterine
tissues using a polyclonal rabbit anti-UBIAD1 antibody (ab191691, Abcam, 5 μg/mL) and ImmPRESS
Universal (Horse Anti-Mouse/Anti-Rabbit IgG) PLUS Polymer Kit (Vector Laboratories, Inc.
Burlingame, CA, USA). The sections were examined using LAS X with DMi8 (Leica, Tokyo, Japan).

176

177 **2.8. Statistical analysis**

Results are expressed as the mean ± standard error of the mean (SEM). Data were analyzed
using the R software package (version 3.6.2) (<u>https://www.r-project.org/</u>). Data were analyzed using
one-way analysis of variance (ANOVA) followed by the Tukey–Kramer test for multiple comparisons
with each group. Differences with P-values < 0.05 were considered statistically significant.

182

185

183 **3. Results**

184 **3.1. Expression of UBIAD1 in bovine endometria**

The expression of UBIAD1 mRNA was detected in bovine endometria in the early, mid, and

186 late estrous stages. No significant differences were detected among the stages (P > 0.05), indicating a 187 stable expression. Likewise, western blotting and immunostaining revealed that the UBIAD1 protein 188 was detectable throughout the estrous stages, and no significant differences were detected among the 189 stages (P > 0.05) (Figure 1).

190

191 **3.2. Effects of MK-4 on gene expression of bovine endometrial epithelial cells**

192 To identify target candidate genes of MK-4 in bovine uterine endometrial epithelial cells, we 193 first conducted RNA-sequencing. Based on the RNA-sequencing analysis using iDEP, 50 differentially 194 expressed genes (DEGs), including 42 upregulated and eight downregulated genes, were found as 195 potential targets of MK-4 (Figure 2). All the DEGs are listed in Table 2. Subsequently, qPCR ensured 196 the expression of the top three upregulated (TRIB3, IL6, and TNFAIP3) and downregulated (CDC6, 197 ORC1, and RRM2) genes in bovine endometrial epithelial cells. Furthermore, a dose- and time-198 dependent increase or decrease in the expression of these genes by MK-4 was confirmed (Figure 3). 199 UBIAD1 expression was not affected by the MK-4 treatment (100 µM, 48 h) (Supplementary Figure 2). 200

201 **3.3.** Enriched Gene Ontology terms in genes upregulated by MK-4 treatment

202 Process terms enriched in the DEGs were analyzed by iDEP (Table 3). Fifteen pathways were 203 found to be enriched: response to organic substance, cellular response to organic substance, apoptotic 204 process, programmed cell death, cell death, developmental process, response to chemical, cellular 205 response to chemical stimulus, response to peptide, response to oxygen-containing compound, cellular 206 response to oxygen-containing compound, positive regulation of cell communication, positive 207 regulation of signaling, cell differentiation, and positive regulation of MAPK cascade. Although gene 208 expression in the apoptotic-related pathways (apoptotic process, programmed cell death, and cell death) 209 was also increased, the expression of effector caspases (CASP3 and CASP7) was not affected 210 (Supplementary Figure 3). Cell viability was also not significantly adversely affected by MK-4 211 treatment (Supplementary Figure 1), as mentioned above.

212

213 **3.4. Key factors in the upregulated pathways**

The top three genes upregulated by MK-4 (*TRIB3*, *IL6*, and *TNFAIP3*) were found in almost all enhanced pathways. In addition, we focused on growth factor genes, *GDF15* and *VEGFA*. These genes were commonly involved in pathways, such as the positive regulation of cell communication, cell differentiation, and positive regulation of MAPK cascade pathways, which are important for cellular functions. A dose- and time-dependent increase in the expression of *GDF15* and *VEGFA* by MK-4 in bovine endometrial epithelial cells was confirmed by qPCR (Figure 4). Furthermore, MK-4 treatment also increased the expression of these genes in human endometrium-derived HHUA and OMC9 cells.

221

239

222 **4. Discussion**

223 UBIAD1 expression is detected in multiple mouse organs, including the uterus [4]. In mice, VK₁ and VK₃ play roles in uterine myometrial contraction [16, 17]. To the best of our knowledge, this 224 225 is the first report showing UBIAD1 expression in bovine endometrial tissue. The presence of UBIAD1 suggests that uterine tissue is one of MK-4's conversion sites. In this study, we confirmed the stable 226 expression of UBIAD1 in bovine endometrial epithelial tissues, which was not affected by the estrous 227 cycle or MK-4 treatment. Although the factors affecting UBIAD1 expression and regulation of MK-4 228 229 conversion activity require further investigation, UBIAD1 may commonly be expressed in mammalian 230 endometrial tissues.

231 Possible targets of MK-4 in bovine endometrial epithelial cells were explored using RNA-232 sequencing analysis. We found 42 upregulated and 8 downregulated DEGs. The top three upregulated 233 genes were TRIB3, IL6, and TNFAIP3, and the top three downregulated genes were CDC6, ORC1, and 234 RRM2. Genes upregulated by MK-4 treatment included GDF15 and TRIB3, which were previously 235 reported as targets of MK-4, although in different animals and tissues [29]. Furthermore, 15 pathways 236 were elevated in bovine endometrial epithelial cells by MK-4 treatment. The top three upregulated genes 237 were found in almost all these pathways. Thus, these factors are suggested to play an important role in 238 reproductive events, and the intrauterine environment may be regulated through their modulation.

TRIB proteins are involved in various cellular events such as inflammation, differentiation,

and proliferation [30–32]. The TRIB family members regulate the innate immune system by interacting with the toll-like receptor (TLR)-mediated nuclear factor kappa-B (NF- κ B) signaling pathways [33– 35], suggesting modulation of the immune environment during implantation and pregnancy [30]. In addition, it was reported that the CHOP/TRIB3/AKT/mTOR axis is involved in the regulation of the invasive potential of normal human endometrial cells [36], while TRIB3 inhibited proliferation and migration and promoted apoptosis of endometrial cancer cells [37]. These findings suggest that TRIB3 is important for normal endometrial cell growth.

The multifunctional cytokine IL-6 has an important role in reproduction, particularly during early embryonic development and implantation [38–41]. In ruminants, IL-6 stimulates protease production, and it is thought to be involved in placentation [42]. IL-6 is also produced by the conceptus in many species, including bovine preimplantation embryos [43, 44]. Although differences in the function of IL-6 from embryonic and endometrial sources are not clear, the importance of adequate IL-6 production during gestation is suggested.

TNFAIP3 encodes the A20 protein, an important regulator of NF- κ B-mediated inflammatory signaling, and defects in this protein in immune cells cause systemic inflammation and autoimmunity [45, 46]. Although findings in the uterus are very limited, A20 is expressed in the rat uterus and human endometrial cells [47, 48], suggesting its role in regulating the immune environment along with other cytokines.

ORC1 and CDC6 play a role in cell-cycle DNA replication [49]. In humans, CDC6 expression is a potential marker for high-grade squamous and glandular dysplasia of the cervix [50, 51]. In mice, RRM2 is a possible marker for cervical cancer [52, 53]. In contrast, however, RRM2 was important for inducing cell proliferation and decidualization in the mouse uterus [54]. The role of these factors in the bovine endometrium is unknown and remains to be validated.

Vitamin K2 shows an inhibitory effect on the growth of tumor cells, including hepatoma cells [55]. Furthermore, VK2 induces an apoptotic effect on leukemia cell lines [56] and fibroblast-like synoviocytes [57]. However, in the present study on primary endometrial epithelial cells, the expression of effector caspases (*CASP3* and *CASP7*) was not affected, and cell viability was not significantly adversely affected by MK-4 treatment. Thus, MK-4 does not appear to be toxic in endometrial epithelial
cells at the doses tested; however, it will be necessary to carefully assess the extent to which *in vitro*trials on cells reflect the situation *in vivo*. Furthermore, the causes and detailed mechanisms underlying
the different effects of MK-4 treatment on cell proliferation in different cell types need to be further
investigated.

272 The growth factors GDF15 and VEGFA were found among the pathways enhanced by MK-4 273 treatment. GDF15, also known as macrophage inhibitory cytokine-1, is found in placental trophoblast 274 cells, decidua, and fetal membranes in humans [58, 59], suggesting that GDF15 is involved in the 275 establishment and maintenance of pregnancy at the maternal-fetal interface. VEGFA is expressed in 276 bovine placental trophoblasts and acts to modulate steroidogenesis during gestation [60], suggesting 277 that VEGF is an important regulator of placental development and function. In this study, the expression 278 of both GDF15 and VEGFA was upregulated by MK-4 in bovine as well as human endometrium-279 derived cells. This suggests that these genes are the common targets of MK-4 in the mammalian uterus, 280 not only in the bovine uterus.

281

282 We recently reported that MK-4 levels in body fluid could be increased by supplemental 283 feeding with VK3 [61]. Therefore, clarifying the physiological function of MK-4 and regulation of MK-284 4 concentrations via feeding would be useful for better management of health conditions, including 285 those affecting the uterus in mammals. The current study was performed using an *in vitro* culture system, 286 but further validation is needed to determine the actual MK-4 concentration and variation in uterine 287 tissue. In addition, we did not compare pregnant and non-pregnant conditions; thus, further studies are 288 required to gain a better understanding of the function of MK-4 and these downstream candidate target 289 genes in implantation and pregnancy.

290

In conclusion, this study confirmed the expression of UBIAD1 in the bovine uterus and found candidate target genes for MK-4 for the first time. In particular, GDF15 and VEGFA were found to be included in most of the pathways enhanced by MK-4 treatment, suggesting their importance. Further

294	studies are needed to expand the understanding of these MK-4 target genes and enhanced biological
295	pathways and their influence on mammalian pregnancy.

505

506 Figure legends

- 507 **Figure 1.** Expression of UBIAD1 in the bovine endometrium
- 508 (A) Data represent the UBIAD1 mRNA expression levels relative to those of the internal control gene,
- 509 H2AFZ. Data are presented as means \pm standard error of the mean (SEM). No significant differences

510 were observed among the stages of expression based on the Tukey–Kramer test (n = 8 per group). E:

511 Early stage, M: Middle stage, L: Late stage.

(B) Left: UBIAD1 protein levels in Early (E), Middle (M), and Late (L) stages (n = 3 each day) in
bovine endometrial epithelial tissues were examined by western blotting. A Rabbit polyclonal antiUBIAD1 antibody was used to detect the protein and ACTB was used as an internal control.
Representative PVDF membrane data from one of the three independent experiments are shown.

Right: Densitometric quantitation was performed using the ImageJ software. The relative densities ofthe blots were determined by normalization against ACTB levels.

518 (C) Immunohistochemical detection of UBIAD1 protein in bovine endometrial epithelial tissues was

519 carried out. Instead of the rabbit polyclonal anti-UBIAD1 antibody, pre-immune serum was used as a

520 negative control. Representative micrographs (Middle stage) from three experiments are shown. Bar =

521 150 μm.

522

523 **Figure 2.** Identification of MK-4 target genes via RNA-sequencing.

(A) Heatmap, (B) Volcano plot, and (C) MA plot of differentially expressed genes. (D) Left: Top 3 upregulated genes by iDEP analysis. Right: Data represent *TRIB3*, *IL6*, and *TNBFAIP3* mRNA expression levels relative to those of *H2AFZ*. Data are presented as means \pm SEM. Different letters indicate significant differences between groups (P < 0.05). (E) Left: Top 3 downregulated genes by iDEP analysis. Right: Data represent *CDC6*, *ORC1*, and *RRM2* mRNA expression levels relative to those of *H2AFZ*. Data are presented as means \pm SEM. Different letters indicate significant differences between groups (P < 0.05).

532 **Figure 3.** Dose- and time- dependent response to MK-4 treatment.

- 533 (A) Expression patterns of upregulated (*TRIB3*, *IL6*, and *TNBFAIP3*) and downregulated (*CDC6*, *ORC1*,
- and *RRM2*) genes with different dosages of MK-4 (1, 10, 50, or 100 µM) for 48 h. Data are presented
- as means \pm SEM. Different letters indicate significant differences between groups (P < 0.05). (B)
- 536 Expression of upregulated (*TRIB3, IL6,* and *TNBFAIP3*) and downregulated (*CDC6, ORC1,* and *RRM2*)
- 537 genes with different treatment times of MK-4. Data are presented as means \pm SEM. Different letters
- 538 indicate significant differences between groups (P < 0.05).
- 539
- 540 **Figure 4.** Expression of *GDF15* and *VEGFA* after MK-4 treatment in endometrial epithelial cells.

541 (A) Expression levels of *GDF15* and *VEGFA* genes induced by MK-4 as identified by iDEP. (B) 542 Expression patterns of GDF15 and VEGFA genes with different dosages of MK-4. Data are presented as means \pm SEM. Different letters indicate significant differences between groups (P < 0.05). (C) 543 544 Expression of GDF15 and VEGFA genes with different treatment times of MK-4. Data are presented 545 as means \pm SEM. Different letters indicate significant differences between groups (P < 0.05). Data 546 represent GDF15 and VEGFA mRNA expression levels after MK-4 treatment in human endometrium-547 derived HHUA (D) and OMC9 (E) cells. Data are presented as means \pm SEM. Different letters indicate 548 significant differences between groups (P < 0.05).

549

550 **Supplemental Figure 1.** The proliferation of bovine endometrial epithelial cells with MK-4 treatment. 551 The cells were treated with different dosages (1, 10, 50, or 100 μ M) of MK-4 for 48 h. SI: stimulation 552 index (absorbance from stimulated wells/absorbance from non-stimulated wells). Data are presented as 553 means ± SEM.

554

555 Supplemental Figure 2. Expression of UBIAD1 after MK-4 treatment in endometrial epithelial cells.

556 (A) Expression levels of the UBIAD1 gene after MK-4 treatment found by iDEP. (B) Relative

557 expression of the *UBIAD1* mRNA level after MK-4 treatment. Data are presented as means \pm SEM.

- 559 Supplemental Figure 3. Enriched GO terms in genes up- and downregulated by MK-4 treatment.
- 560 Visualization of the relationship among enriched GO terms using (A) hierarchical clustering tree and
- 561 (B) network analysis by iDEP. (C) Expression levels of *CASP3* and *CASP7* genes after MK-4 treatment
- 562 found by iDEP. (B) Relative expression of CASP3 and CASP7 mRNA levels after MK-4 treatment.
- 563 Data are presented as means \pm SEM.

Table2. Up- and Down-regulated genes by MK-4 treatment.

a) Up-regulated genes

Ensembl ID	log2 Fold Change	Adj.Pval	Symbol	
ENSBTAG00000017007	2.461114166	1.79E-04	TRIB3 (tribbles pseudokinase 3)	
ENSBTAG00000014921	2.449137992	2.29E-03	IL6 (Interleukin-6)	
ENSBTAG0000000436	2.184366524	4.10E-02	TNFAIP3 (TNF alpha induced protein 3)	
ENSBTAG00000018984	2.159385069	1.23E-03	PIK3CD (phosphatidylinositol-4,5-bisphosphate 3-kinase catalytic subunit delta)	
ENSBTAG0000005947	2.112214916	2.29E-03	PLAU (plasminogen activator, urokinase)	
ENSBTAG00000014972	2.095797253	7.11E-03	PTGER4 (prostaglandin E receptor 4)	
ENSBTAG00000031544	2.065043909	3.12E-04	DDIT3 (DNA damage inducible transcript 3)	
ENSBTAG0000000396	1.894514299	9.69E-03	PIM1 (Pim-1 proto-onco, serine/threonine kinase)	
ENSBTAG0000001164	1.771105294	2.66E-02	ACAD10 (acyl-CoA dehydrogenase family, member 10)	
ENSBTAG00000010371	1.723474969	4.42E-05	CHAC1 (ChaC glutathione specific gamma-glutamylcyclotransferase 1)	
ENSBTAG00000015618	1.709271336	2.66E-02	GDF15 (Growth differentiation factor 15)	
ENSBTAG0000001294	1.696425758	2.80E-04	PPP1R15A (protein phosphatase 1 regulatory subunit 15A)	
ENSBTAG00000018517	1.628181331	2.51E-02	VLDLR (very low density lipoprotein receptor)	
ENSBTAG0000003721	1.585932683	4.63E-02	CHST1 (carbohydrate sulfotransferase 1)	
ENSBTAG0000006016	1.580148876	3.35E-07	GTPBP2 (GTP binding protein 2)	
ENSBTAG00000049724	1.5272723	4.10E-02		
ENSBTAG00000052132	1.514267909	3.62E-02	FOXQ1 (forkhead box Q1)	
ENSBTAG00000016589	1.476011022	3.10E-02	PRPF40B (pre-mRNA processing factor 40 homolog B)	
ENSBTAG0000007718	1.415412002	2.66E-02	TGIF1 (TGFB induced factor homeobox 1)	
ENSBTAG00000015591	1.414794722	1.60E-05	SQSTM1 (sequestosome 1)	
ENSBTAG0000008197	1.385601005	4.86E-04	EPOR (erythropoietin receptor)	
ENSBTAG0000003495	1.318811724	4.73E-02	KDM7A (lysine demethylase 7A)	

ENSBTAG00000021435	1.309982877	1.23E-03	MAFF (MAF bZIP transcription factor F)
ENSBTAG00000020283	1.293512886	4.10E-02	DUSP5 (dual specificity phosphatase 5)
ENSBTAG00000013240	1.251476504	4.08E-02	SLC3A2 (solute carrier family 3 member 2)
ENSBTAG0000005339	1.245961794	2.51E-02	VEGFA (vascular endothelial growth factor A)
ENSBTAG0000002395	1.177123204	1.17E-02	HPS3 (HPS3 biosis of lysosomal organelles complex 2 subunit 1)
ENSBTAG00000016010	1.155584116	2.66E-02	KLHL7 (kelch like family member 7)
ENSBTAG00000013860	1.152909703	3.97E-02	GADD45A (Growth arrest and DNA damage inducible alpha)
ENSBTAG0000003245	1.147468004	3.06E-02	BCAR3 (BCAR3 adaptor protein, NSP family member)
ENSBTAG0000006367	1.110662169	3.87E-02	CCN2 (cellular communication network factor 2)
ENSBTAG0000006082	1.109992873	2.66E-02	DNASE2 (deoxyribonuclease 2, lysosomal)
ENSBTAG00000017877	1.102189224	1.06E-02	NECTIN4 (nectin cell adhesion molecule 4)
ENSBTAG0000009863	1.053959663	3.28E-02	BHLHE40 (basic helix-loop-helix family member e40)
ENSBTAG00000025434	1.051051791	1.91E-04	ZFP36L1 (ZFP36 ring finger protein like 1)
ENSBTAG00000023963	1.04080726	3.16E-02	RHBDD1 (rhomboid domain containing 1)
ENSBTAG00000011934	1.035375901	2.51E-02	PCK2 (phosphoenolpyruvate carboxykinase 2, mitochondrial)
ENSBTAG00000015013	1.034400723	2.66E-02	C2CD2L (C2CD2 like)
ENSBTAG00000024539	1.032965721	1.10E-02	SPSB1 (splA/ryanodine receptor domain and SOCS box containing 1)
ENSBTAG0000002922	1.028178649	1.55E-02	GAB2 (GRB2 associated binding protein 2)
ENSBTAG00000013235	1.013137709	2.66E-02	TINAGL1 (tubulointerstitial nephritis antigen like 1)
ENSBTAG0000002069	1.004799324	2.66E-02	BOLA (MHC class I heavy chain)

Adj.Pval; adjusted p-value, calculated by iDEP.

b) Down-regulated genes

Ensembl ID	log2 Fold Change	Adj.Pval	Symbol
ENSBTAG00000010384	-1.51589	2.01E-02	CDC6 (cell division cycle 6)
ENSBTAG0000002719	-1.44119	4.10E-02	ORC1 (origin recognition complex subunit 1)

ENSBTAG00000039462	-1.07962	4.10E-02	PCLAF (PCNA clamp associated factor)
ENSBTAG0000000532	-1.12283	2.66E-02	EXO5 (exonuclease 5)
ENSBTAG0000003323	-1.132	3.87E-02	NOL6 (nucleolar protein 6)
ENSBTAG0000000064	-1.17745	3.06E-02	FEN1 (flap structure-specific endonuclease 1)
ENSBTAG00000014435	-1.25222	2.51E-02	TCF19 (transcription factor 19)
ENSBTAG0000008216	-1.33388	1.19E-03	RRM2 (ribonucleotide reductase regulatory subunit M2)

Adj.Pval; adjusted p-value, calculated by iDEP.

Adj.Pval	nGenens	Pathways	
0.000442327	17	Response to organic substance	
0.000749619	15	Cellular response to organic substance
