A TAXONOMIC STUDY OF THE SUBFAMILY CALLIPTERINAE IN JAPAN

(HOMOPTERA: APHIDIDAE)

By HIROMICHI HIGUCHI
Entomological Institute, Faculty of Agriculture
Hokkaido University, Sapporo

Introduction

The Callipterinae, a relatively small and rather primitive subfamily of the family Aphididae, are widely distributed over the world, including more than 450 species. This subfamily, characterized by the knobbed or semi-circular cauda and the often bilobed anal plate, is represented by more than 70 species in Japan and they are mainly eastern Palaearctic with some Oriental species. The aphids of this group live mostly in monophagous holocycle. Moreover, so far as their habits are known most of the species pass their lives on the foliages, young shoots and branches of broadleaved trees, some others occurring on conifers, bamboos and sedges and a few, such as *Therioaphis trifolii* (Monell), attack pasturage (Leguminosae).

From the economic standpoint, the Aphididae are one of the most important groups of insects in agriculture, because sometimes they cause serious damages to their host plants by sucking sap and, moreover, in transmitting plant viruses. In this subfamily about 25 species have been known to be virus vectors, of which one, Therioaphis maculata (Buckton), is well known as a vector of the clover vein mosaic virus.

Insofar as the present investigation goes, more than 60 species of this subfamily have been recorded from Japan by Matsumura (1917, 1919), Essig & Kuwana (1918), Shinji (1917–1944), Takahashi (1919–1961), Moritsu (1953), Higuchi (1968, 1969), etc. Up to the present time, however, no general taxonomic work has been published except for the "Monograph of Japanese Aphids" given by Shinji (1941). Since 1965 I have carried on a taxonomic study of this subfamily and this paper is the first attempt to review and arrange the species of Japan according to the recent taxonomic knowledge. In this paper will be given 83 species, of which 9 are new to science and 7 new to Japan. Furthermore, 2 new genera are described herein. All the types of the new species described in this paper are deposited in the collection of the Entomological Institute, Hokkaido University.

Before preceding further, I wish to express my sincere thanks to Prof. C. Watanabe of the Hokkaido University for his continuous kind guidance and encouragement during the course of the present study. I am especially obliged to Dr. D. Hille Ris Lambers of Bennekom, Netherlands, Dr. V. F. Eastop of the British Museum, England, and Dr. F. W. Quednau of the Forest Research Laboratory, Canada, for the valuable specimens for comparison and for their helpful suggestions. Many thanks are also

due to Dr. T. Tanaka of the Utsunomiya University, Dr. M. Moritsu of the Yamaguchi University, Dr. M. Sorin of the Kôgakukan University, and Dr. M. Miyazaki of the Hokkaido University for their kindness in various ways. I am indebted to Dr. K. Ito of the Hokkaido University and Dr. K. Moriya of the Utsunomiya University for their kindness in identifying the host plants, and also to Professor Dr. A. N. Tissot of the Florida University, U.S.A., and Dr. H. Szelegiewicz of the Polish Academy of Sciences, Poland, for the loan of specimens for comparison, and to Dr. Paul H. Arnaud of the California Academy of Sciences, U.S.A., for his kindness in giving me the opportunity to examine Essig & Kuwana's holotypes. Acknowledgements are made to Dr. H. Takada of the Kyoto Prefectural University and Dr. K. Kusigemati of the Kagoshima University for their kindness in offering valuable specimens.

Classification

Family **Aphididae**Subfamily **Callipterinae**

This subfamily is represented in Japan by thirty-seven genera, which may be placed in the following 8 genus-groups:—

Myzocallis group (= Callaphidini of Börner, 1952)

Chromocallis, Mesocallis, Myzocallis, Neochromaphis, Paratinocallis (gen. nov.), Recticallis, Sappocallis, Shivaphis, Takecallis, Tiliaphis, Tinocallis, and Tuberculatus

Symydobius group (= Phyllaphidini of Börner, 1952)

Betacallis, Betulaphis, Boernerina, Calaphis, Callipterinella, Clethrobius, Euceraphis, Hannabura, Monaphis, Neobetulaphis, Neocalaphis and Symydobius

Diphyllaphis group

Diphyllaphis, Machilaphis, and Phyllaphis

Saltusaphis group (= Saltusaphidini of Börner, 1952)

Subsaltusaphis and Thripsaphis

Yamatocallis group (= Drepanosiphini of Börner, 1952)

Yamatocallis

Chaitophorus group (= Chaitophorini of Eastop, 1966)

Chaitophorus and Periphyllus

Trichaitophorus group

Trichaitophorus and Yamatochaitophorus (gen. nov.)

Neophyllaphis group (= Neophyllaphidini of Eastop, 1966)

Neophyllaphis

Isolated genera

Dasyaphis and Parachaitophorus

Myzocallis group

This is the largest group of this subfamily, being characterized by the combination of the following characters:—Apterae viviparae not produced except for *Mesocallis* and *Shivaphis*. Alatae mostly bearing only inconspicuous body setae. Processus terminalis 0.1–2.0 times as long as base of 6th antennal segment. Ultimate rostral segment with 2–16 secondary setae. Apical tibial setae differing from other tibial setae. First tarsal segment with 5–7 ventral setae and a pair of dorsal setae. Empodial setae flattened. Eighth abdominal segment with 2–20 setae. Rudimentary gonapophyses 1

or 2 in number. Wax plates mostly absent.

This group differs from the Symydobius group by the absence of pleural abdominal setae in the embryonic stage. In the embryo examined the shape of dorsal setae is capitate except for Shivaphis and the spinal setae are not arranged in parallel rows except for Myzocallis, Shivaphis, Takecallis, and Tuberculatus. There is no remarkable difference between Recticallis and Pterocallis in the embryonic stage. Shivaphis is represented by only a single species, Shivaphis celti Das, which is widely distributed in the Oriental region. It has been referred to the Symydobius group by most authors. Examining the present material, however, I have been convinced that the genus should be placed in this group.

1. Genus Chromocallis Takahashi

References. Takahashi 1961 b; 253.

Type-species. Chromaphis nirecola Shinji, 1933.

This genus is closest to *Callaphis* Walker of Europe, but it is differentiated from the latter by the longer processus terminalis, by the abdomen without pigmented sclerites, and by the smaller primary sensoria. It is represented by only a single species occurring in Japan.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 41, H, the setae being long, capitate; spinal setae variable in length, not arranged in parallel rows; pleural setae absent. Cornicle visible.

Host plants: Ulmaceae. Distribution: Eastern Asia.

1. Chromocallis nirecola (Shinji)

References. Shinji 1933 d: 210 [Chromaphis]; ibid. 1941: 339 [Chromaphis]; Takahashi 1961 b: 253.

Only the alate viviparous female of the species has hitherto been described. On the basis of the present specimens a brief description of the alate male is given as follows:—

Alate male: Body smaller, about 1.69 mm. including cauda. Antennae about 0.8 as long as body; 3rd segment with 20 or 21 secondary sensoria, 4th with 3 or 4, 5th with 5-7, and 6th with 2-4; length of 3rd-6th segments in proportion 32.5:16.5:15.5:11+7. Ultimate rostral segment about 0.75 as long as 2nd segment of hind tarsus. Abdomen with black patches on each segment, but the patches on 3rd-6th segments being very small. Dorsal setae shorter than in alate viviparous female, measurements of maximal setae in mm. as follows:—head: 0.019, antenna (3rd seg.): 0.015, abdomen (6th seg.): 0.030, leg (hind tibia): 0.078.

Alate viviparous female: Measurements of 10 specimens in mm. Body 2.84 (2.44–3.12); antennal segments (1st–6th): 0.07 (0.06–0.08), 0.06 (0.06–0.07), 0.54 (0.46–0.60), 0.27 (0.21–0.29), 0.25 (0.18–0.29), 0.16 (0.12–0.19)+0.08 (0.06–0.10); ultimate rostral segment 0.12 (0.11–0.12); hind femur 0.73 (0.68–0.82); hind tibia 1.80 (1.65–1.95); 2nd segment of hind tarsus 0.15 (0.14–0.16); longest seta on head 0.036 (0.027–0.042), that on 3rd antennal segment 0.027 (0.019–0.038), that on 6th abdominal segment 0.031 (0.023–0.039), that on hind tibia 0.152 (0.130–0.169).

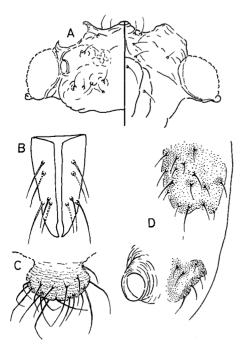

Fig. 1. Chromocallis nirecola Shinji.

Alate viviparous female:—A,
head; B, ultimate rostral segment; C, cauda; D, cornicle
and marginal sclerite.

Specimens examined*: Many alate viviparous females, Sapporo, Hokkaidô, 13-vi-1967, ex *Ulmus davidiana* var. *japonica*; Ônuma, Hokkaidô, 18-vi-1967, ex *Ulmus davidiana* var. *japonica* f. *suberosa*. 1 alate male, Sapporo, Hokkaidô, 28-ix-1967, ex *Ulmus davidiana* var. *japonica*.

Host plants: Ulmus campestris var. major (Rehd.) (after Shinji, 1941), Ulmus davidiana var. japonica (Rehd.), Ülmus davidiana var. japonica f. suberosa Nakai.

Distribution: Japan (Hokkaidô; Honshû).

2. Genus Mesocallis Matsumura

References. Matsumura 1919: 103; ibid. 1919: 104 [Neocallis]; Takahashi 1961 b: 247 [Nippochaito-phorus].

Synonyms. Neocallis Matsumura, 1919 [type-species: (Neocallis carpinicola Matsumura, 1919) = Mesocallis sawashibae (Matsumura, 1917)]. Syn. nov. Nippochaitophorus Takahashi, 1961 [type-species: (Nippochaitophorus moriokaensis Takahashi, 1961) = Mesocallis sawashibae (Matsumura, 1917)]. Syn. nov.

Type-species. *Myzocallis sawashibae* Matsumura, 1917.

Mesocallis Matsumura was erected with Myzocallis sawashibae Mats., 1917, as the type-species, but has since been neglected, as its few species known have been placed in Myzocallis, Nippochaitophorus, Tinocallis, etc. In general appearance this genus is very similar to Tinocallis Matsumura, but it differs from the latter by the absence of finger-like tubercles on body.

Embryo: Dorsal abdominal chaetotaxy as shown in Figs. 41, A & B, the setae being long, capitate; spinal setae variable in length, not arranged in parallel rows; pleural setae absent. Cornicle visible.

Host plants: Betulaceae. Distribution: Eastern Asia.

Key to the Japanese species of Mesocallis

Alate viviparous female

- Head with vertex not pigmented. Third antennal segment not pigmented except at apex.

^{*} The specimens are collected by the author unless otherwise stated.

1. Mesocallis pteleae Matsumura

References. Matsumura 1919: 103; Shinji 1935 a: 284 [Agrioaphis hashibamii]; ibid. 1941: 1148 [Myzocallis colyricola]; Tao 1963: 57 [Myzocallis hashibamii].

Synonyms. Agrioaphis hashibamii Shinji, 1935. **Syn. nov.** Myzocallis colyricola Shinji, 1941. **Syn. nov.**

Alate viviparous female: Body pale yellow in life. In mounted specimens, head pale; vertex fuscous. Antennae fuscous; 4th on basal half and 5th on basal half pale. Abdomen pale. Cornicle and cauda pale. Fore legs: tibiae and tarsi fuscous; middle legs: tibiae at apex and tarsi fuscous; hind legs: femora at apex, tibiae and tarsi fuscous. Wings (fig. 2, F): anal vein bordered with brown. Body about 1.6 mm. in length. Head (fig. 2, A) smooth, without tubercles on dorsum; cephalic setae

inconspicuous, the longest seta 0.2-0.6 as long as middle breadth of 3rd antennal segment. Antennae short, 0.62 as long as body; 3rd segment (fig. 2, C) imbricated, with 7-14 (mostly 12) secondary sensoria; processus terminalis 0.79-1.0 as long as base of 6th antennal segment; length of 3rd-6th segments in proportion 21:13:12:6+6. Antennal setae short, at most 1/4 as long as middle breadth of 3rd antennal segment; 3rd segment with 5-8 setae. Clypeus with a pair of anterior setae; mandibular lamina with a seta. Rostrum not reaching middle coxae; ultimate segment (fig. 2, D) slender, 1.23-1.38 (mostly 1.27) times as long as 2nd segment of hind tarsus, with 6-12 setae besides apical ones. Pronotum and mesonotum without spinal tubercles; prothoracic setae about equal to cephalic setae in length. Legs: tibiae with spinules on distal 6/7; 1st tarsal segment (fig. 2, E) with 5 setae ventrally and 2 dorsally. Abdomen sometimes with small tubercles on anterior segments, but without finger-like tubercles. Dorsal abdominal chaetotaxy as shown in Fig. 2,

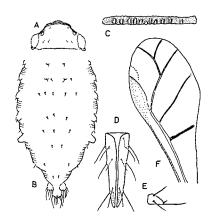

Fig. 2. Mesocallis pteleae Matsumura. Alate viviparous female:—A head; B, abdomen; C, 3rd antennal segment; D, ultimate rostral segment; E, 1st segment of hind tarsus (lateral view); F, fore wing.

B; 2nd-5th segments with 2-6 setae (spinal and pleural), of which the longest one is 0.4-0.8 as long as middle breadth of 3rd antennal segment; marginal seta of 6th segment not attached to the base of cornicle; anterior segments with marginal tubercles, the tubercles on 3rd and 4th segments being much larger than the rest, but much smaller than cornicles. Cornicles 0.5-0.8 as long as 2nd segment of hind tarsus, at most 4/5 as long as base of 6th antennal segment, without flange. Cauda knobbed and anal plate bilobed, both bearing only elongate setae with pointed apices.

Specimens examined: Some alate viviparous females (syntypes), Sapporo, Hokkaidô, 23-vi-1917, ex *Betula* sp., S. Matsumura leg. Many alate viviparous females

taken at the following localities in Honshû: Oirase, Aomori-ken, 21-vi-1967, ex *Corylus sieboldiana*; Morioka, Iwate-ken, 4-viii-1960, ex *Corylus* sp., R. Takahashi leg.; Sendai, Miyagi-ken, 27-vi-1967, ex *Corylus sieboldiana* var. *mandshurica*; Tôkyô, 3-viii-1957, ex *Carpinus* sp., R. Takahashi leg.; Hirayu, Gifu-ken, 12-viii-1959, ex *Alnus matsumurae*, R. Takahashi leg.; Ôsaka, 29-vi-1959, ex *Alnus* sp., R. Takahashi leg.

Host plants: Alnus matsumurae Callier, Carpinus sp., Corylus heterophylla var. thunbergii Blume (after Shinji, 1935), Corylus sieboldiana Blume, Corylus sieboldiana var. mandshurica (Maxim.). Matsumura (1919) gives Ptelea trifoliata as host plant. This may not be a true host of this aphid. In China Alnus cremstogyne and Betula sp. have been recorded as hosts (after Tao, 1963).

Distribution: Japan (Hokkaidô; Honshû); China.

Having read the original description of Agrioaphis hashibamii Shinji, I have been convinced that it should be suppressed as a synonym of Mesocallis pteleae Matsumura.

2. Mesocallis sawashibae (Matsumura)

References. Matsumura 1917: 374 [Myzocallis]; ibid. 1919: 103.

Synonyms. Neocallis carpinicola Matsumura, 1919. **Syn. nov.** Nippochaitophorus moriokaensis Takahashi, 1961. **Syn. nov.**

Alate viviparous female: Head, thorax and abdomen pale yellow. Antennae pale yellow; 3rd-5th segments at apex fuscous. Legs pale dirty. Body about 1.5 mm. in length. Head (fig. 3, C) smooth, without tubercles on dorsum; cephalic setae short, the longest seta 0.43-0.75 as long as middle breadth of 3rd antennal segment. Antennae short, 0.63 as long as body; 3rd segment (fig. 3, E) not imbricated, with 7-9 (mostly 8) secondary sensoria; processus terminalis 1.0-1.2 times as long as base of 6th antennal segment; length of 3rd-6th segments in proportion 20:14:11:6+6. Antennal setae at most 3/4 as long as middle breadth of 3rd antennal segment; 3rd segment with 3-5 setae. Clypeus with a pair of anterior setae; mandibular lamina with a seta. Rostrum reaching a little past fore coxae; ultimate segment (fig. 3, G) 0.8-0.9 as long as 2nd segment of hind tarsus, with 2-4 setae besides apical ones. Prothoracic setae as long as or a little shorter than cephalic setae. Legs: tibiae with spinules on distal 2/5-3/4; 1st segment of all tarsi with 5 setae ventrally and 2 setae dorsally. Abdomen (fig. 3, D) not having finger-like tubercles; 2nd-4th segments with marginal tubercles. Dorsal abdominal setae inconspicuous; the marginal seta of 6th not attached to the base of cornicle. Cornicles 0.5-0.6 as long as 2nd segment of hind tarsus, at most 6/11 as long as base of 6th antennal segment, without flange. Cauda knobbed and anal plate bilobed, both bearing only elongate setae with pointed apices.

Oviparous female: Body about 12.5 mm., with many long capitate setae. Head with 8 dorsal setae which are 7 or 8 times as long as middle breadth of 3rd antennal segment. Antennae 5- or 6-segmented, about 0.42 as long as body; length of 3rd-5th segments in proportion 16.2:7:7.5+5. Antennal setae short, at most 1/2 as long as middle breadth of 3rd antennal segment. Ultimate rostral segment 0.7-0.9 as long as 2nd segment of hind tarsus, with a pair of secondary setae. Abdomen: 1st-6th segments with 4 long, capitate setae including marginal ones; the longest seta on 6th segment 8-11 times as long as middle breadth of 3rd antennal segment. Hind tibiae bearing about 20 pseudosensoria.

Apterous viviparous female: Measurements of 5 specimens (syntypes of Nippo-chaitophorus moriokaensis Tak.) in mm. Body 0.83 (0.79–0.84); antennal segments (1st–5th): 0.03 (--), 0.03 (--), 0.11 (0.11–0.13), 0.05 (0.05–0.06), 0.07 (--)+0.06 (0.06–0.07); ultimate rostral segment 0.05 (0.05–0.06); hind femur 0.15 (0.14–0.17); hind tibia 0.25 (0.23–0.25); 2nd segment of hind tarsus 0.07 (--); longest seta on head 0.072 (0.057–0.075), that on 3rd antennal segment 0.005 (--), that on 6th abdominal segment 0.0136 (0.0129–0.0152), that on hind tibia 0.023 (0.023–0.026).

Specimens examined: 5 alate viviparous females, Sapporo, Hokkaidô, 18-x-1915, ex *Carpinus cordata*, S. Matsumura leg.; Morioka, Iwate-ken, 24-vi-1967, ex *Carpinus*

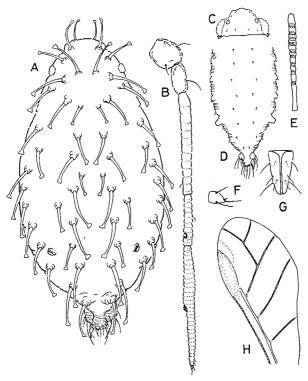

Fig. 3. Mesocallis sawashibae (Matsumura). Apterous viviparous female:— A, outline of the aphid; B, antennae. Alate viviparous female:— C, head; D, abdomen; E, 3rd antennal segment; F, 1st segment of hind tarsus (lateral view); G, ultimate rostral segment; H, fore wing.

cordata. Some apterous viviparous females, Morioka, Iwate-ken, 4-viii-1960, R. Takahashi leg. (syntypes of *Nippochaitophorus moriokaensis* Tak.). Some oviparous females, Sapporo, Hokkaidô, 18-x-1915, ex *Carpinus cordata*, S. Matsumura leg.; 9-x-1916, ex *Carpinus cordata*, S. Matsumura leg. (syntypes of *Neocallis carpinicola* Mats.).

Host plants: Carpinus cordata Blume. Takahashi (1961) gives Acer sp. as a host plant of Nippochaitophorus moriokaensis, but this plant seems not to be a true host of this aphid.

Distribution: Japan (Hokkaidô; Honshû).

Having compared a syntype of Neocallis carpinicola Mats. with the present species, I have come to the conclusion that they should be treated as a single species. Nippochaitophorus moriokaensis Tak., described from a few apterae taken at Morioka, may be rightly identified with sawashibae. As far as I am aware, the aptera of sawashibae is unknown, while in N. moriokaensis only the aptera has hitherto been described. Therefore, I could not examine the same morphs of these species, but in comparison with the oviparous female of sawashibae the aptera of moriokaensis resembles the former in main points, e.g. the shape and arrangement of dorsal setae; the shape of antenna and the number of antennal segment; the shape of primary sensoria; the number of secondary setae of ultimate rostral segment; the shape of apical tibial setae, etc.

3. Genus Myzocallis Passerini

References. Passerini 1860: 28; Swain 1919: 21 (part); Baker 1920: 29 (part); Theobald 1927: 331 (part); Palmer 1952: 70 (part); Börner 1952: 61; Cottier 1953: 109 (part); Boudreaux et Tissot, 1962: 122; Eastop 1966: 512 (part); Richards 1965: 29; ibid. 1968 b: 4.

Synonyms. Agrioaphis Walker, 1870 [type-species: Aphis myricae Kaltenbach, 1843]; Nippocallis Matsumura, 1917 [type-species: Nippocallis kuricola Matsumura, 1917].

Type-species. Aphis coryli Goeze, 1778.

This is the largest and commonest genus of this subfamily, but in Japan are known to occur only three species, of which one is described here as a new species.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 41, L, the setae being capitate; spinal setae arranged in parallel rows; pleural setae absent. Cornicle visible.

Host plants: Fagaceae, Betulaceae, Asclepiadaceae and Myricaceae.

Distribution: Holarctic and Australian regions.

Key to the Japanese species of Myzocallis

Alate viviparous female

1. Myzocallis kuricola (Matsumura)

References. Matsumura 1917: 365 [Nippocallis]; Essig et Kuwana 1918: 92; Takahashi 1923: 124; Okamoto et Takahashi 1926: 143; Shinji 1927: 20 [Callipterus]; Hori 1929: 152; Shinji 1941: 316; Tao 1963: 64 [Nippocallis]; Paik 1965: 51 [Nippocallis]; Richards 1968 b: 37.

So far as I am aware, the oviparous female of the species has not hitherto been described. On this occasion a brief description of the oviparous female is given as follows:—

Oviparous female: Differs from the alate viviparous female:—Body larger, about 2.02 mm. in length. Antennae 0.50 as long as body; length of 3rd-6th segments in

proportion 23:12.5:11:7+6.5. Ultimate rostral segment about 0.97 as long as 2nd segment of hind tarsus. Hind tibiae with 60 or more pseudosensoria along whole length.

	alate vivip. female	alate male	oviparous female
head	98–129 av. 114	106	106-144 av. 125
antenna	61- 83	64	106-114
(3rd seg.)	av. 71		av. 110
abdomen	121-136	106	136–152
(6th seg.)	av. 126		av. 144
leg	53– 61	68	83– 91
(hind tibia)	av. 55		av. 87

Table 1. Chaetotactic data for *Myzocallis kuricola* (Matsumura). Measurements of maximal setae in micra:

Examined specimens: May alate viviparous females, Sendai, Miyagi-ken, 27-vi-1967, ex *Castanea crenata*; Kinugawa, Tochigi-ken, 13-vii-1967, ex *Castanea crenata*. 1 alate male, Ôsaka, 14-xi-1954, ex *Castanea crenata*, R. Takahashi leg. 2 oviparous females, Ôsaka, 14-xi-1954, ex *Castanea crenata*, R. Takahashi leg.

Host plants: Castanea crenata Sieb. & Zucc., Quercus acutissima Carruth. (after Essig et Kuwana, 1918).

Distribution: Japan (Honshû; Shikoku; Kyûshû); Formosa; China; Korea.

This species is easily distinguished from any other congeneric species by the veins of fore wing bordered dusky, by the longer dorsal setae, and by the host relationship.

2. Myzocallis montana, sp. nov.

Alate viviparous female: Head, thorax and abdomen pale yellow. Antennae pale; 3rd-5th segments at apex brown. Legs yellow; tibiae at apex and tarsi brown. Cornicle and cauda yellow. Body about 1.15 mm. in length. Head smooth; vertex convex; cephalic setae short, pointed, 0.8-0.9 as long as middle breadth of 3rd antennal segment. Antennae spiculosely imbricated, 0.47-0.56 as long as body; 3rd segment with 2 or 3 circular or oval secondary sensoria; 6th with primary sensorium surrounded by setae; 1 or 2 of accessory sensoria apart from primary one; processus terminalis 0.21-0.43 as long as base of 6th antennal segment; length of 3rd-6th segments in proportion 12:8:7.5:7+2.5. Antennal setae very short, at most 1/2 as long as middle breadth of 3rd antennal segment. Clypeus with a pair of anterior setae; mandibular lamina with a seta. Rostrum extending to midway between fore and middle coxae; ultimate segment 0.78-0.85 as long as 2nd segment of hind tarsus, with 2 secondary setae. Legs: tibiae with spinules on distal 3/5-4/5; longest tibial seta 2.2-2.9 times as long as middle breadth of 3rd antennal segment; 1st tarsal segment bearing 5 ventral setae and 2 dorsal setae. Abdomen (fig. 4, B) smooth; anterior segments with marginal sclerites bearing 2 pointed setae; 6th segment with 2 setae between cornicles, the longest seta being 0.72-0.94 as long as middle breadth of 3rd antennal segment; 8th segment with 3 setae. Cornicles short, at most 1/2 as long as 2nd segment of hind tarsus. Cauda knobbed, bearing 10-12 setae. Anal plate

bilobed.

Specimens examined: Some alate viviparous females (syntypes), Mt. Yatsugatake, Yamanashi-ken, 31-vii-1967, ex Corylus sieboldiana.

Host plants: Corylus sieboldiana Blume.

Distribution: Japan (Honshû).

This species is an aberrant member of the genus. It differs from any other congeneric species in having short processus terminalis (fig. 4, C).

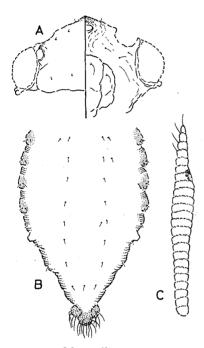

Fig. 4. Myzocallis montana, sp. nov. Alate viviparous female:—A, head; B, abdomen; C, 6th antennal segment.

Species of Myzocallis not included in the key

3. Myzocallis coryli (Goeze)

References. Goeze 1778: 31 [Aphis]; Shinji 1941: 309; Richards 1968b: 21.

Synonyms. Aphis avellanae Blanchard, 1840.

Host plants: Carpinus cordata Blume and Corylus sieboldiana Blume (after Shinji, 1941).

Distribution: Japan (after Shinji, 1941); Europe, North America, Australia and New Zealand (after Richards, 1968).

As I have seen no representatives of this species, it is excluded from the key. According to Richards' description (1968, p. 21-22) this species may be distinguished from other congeneric species in Japan by the combination of the following characters:—
(1) Processus terminalis at least twice as long as base of 6th antennal segment. (2) Ultimate rostral segment with 9-14 secondary setae. (3) Cephalic setae at most as long as basal breadth of 3rd antennal segment. (4) Each abdominal segment with 2 median or spinal clusters consisting of 3-5 setae.

4. Genus Neochromaphis Takahashi

References. Takahashi 1921 a: 24; ibid. 1961 c: 12.

Type-species. (Neochromaphis carpini Takahashi, 1921) = Chromaphis carpinicola Takahashi, 1921.

This genus is Asiatic, being closely related to *Chromaphis* Walker, 1870, of Europe and North America, but it may be distinguished from the latter by the setal pattern of the embryo (figs. 41, I & J) and by the wing with large dark markings (fig. 5, C). In Japan two species have been known to occur.

Embryo: Dorsal abdominal chaetotaxy as shown in Figs. 41, I & J, the setae being long, blunt or faintly capitate; spinal setae variable in length, not arranged in parallel rows; pleural setae absent. Cornicle visible.

Host plants: Betulaceae.

Distribution: Eastern Asia.

Key to the Japanese species of Neochromaphis

Alate viviparous female

1. Neochromaphis carpinicola (Takahashi)

References. Takahashi 1921 a: 21 [Chromaphis]; ibid. 1921 a: 24 [carpini]; ibid. 1961 c: 13.

Synonyms. Neochromaphis carpini Takahashi, 1921.

Alate viviparous female: Measurements of 5 specimens in mm. Body 1.85 (1.70–1.95); antennal segments (1st–6th): 0.05 (--), 0.06 (0.05–0.06); 0.35 (0.34–0.35); 0.22 (0.18–0.23); 0.20 (0.19–0.21); 0.11 (0.11–0.12)+0.02 (0.01–0.02); ultimate rostral segment 0.11 (0.10–0.11); hind femur 0.27 (0.27–0.29); hind tibia 0.66 (0.65–0.68); 2nd segment of hind tarsus 0.09 (--); longest seta on head 0.055 (0.045–0.065), that on 3rd antennal segment 0.015 (0.011–0.023), that on 6th abdominal segment 0.027 (0.023–0.030), that on hind tibia 0.028 (0.027–0.030).

Specimens examined: 8 alate viviparous females, Tôkyô, 19-v-1949, 25-vii-1958, 28-vii-1959, ex *Carpinus* sp., R. Takahashi leg.

Host plants: Carpinus japonica Blume (after Takahashi, 1921), Carpinus tschonoskii Maxim. (after Takahashi, 1921), Carpinus sp. Distribution: Japan (Honshû).

2. Neochromaphis coryli Takahashi

References. Shinji 1941: 336 [Chromaphis carpinicola]; Takahashi 1961 c: 12; Paik 1965: 45 [Chromaphis carpinicola].

Alate viviparous female: Measurements of 10 specimens in mm. Body 1.84 (1.58–2.21); antennal segments (1st–6th): 0.06 (0.05–0.06), 0.06 (0.05–0.06), 0.35 (0.29–0.38), 0.17, (0.14–0.18), 0.17 (0.14–0.20), 0.11 (0.10–0.13)+0.03 (0.02–0.03); ultimate rostral segment 0.14 (0.11–0.15); hind femur 0.36 (0.30–0.40); hind tibia 0.72 (0.63–0.79); 2nd segment of hind tarsus 0.10 (0.09–0.11); longest seta on head 0.068 (0.053–0.076), that on 3rd an-

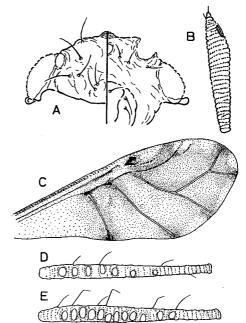

Fig. 5. Neochromaphis carpinicola (Takahashi) (A-D) and N. coryli Takahashi (E). Alate viviparous female:—
A, head; B, 6th antennal segment; C, fore wing; D
& E, 3rd antennal segment.

tennal segment 0.049 (0.038-0.053), that on 6th abdominal segment 0.057 (0.045-0.061), that on hind tibia 0.061 (0.061-0.068).

Specimens examined: Many alate viviparous females (including syntypes of *coryli* Tak.), Morioka, Iwate-ken, 4-viii-1960, ex *Corylus sieboldiana*, R. Takahashi leg.

Host plants: Corylus sieboldiana Blume, Carpinus laxiflora (Sieb. & Zucc.) (after Shinji, 1941). In Korea Corylus heterophylla has been recorded as host (after Paik, 1965).

Distribution: Japan (Honshû); Korea.

The aphid mentioned under the name *Chromaphis carpinicola* by Paik (1965) seems to be referred to the present species.

5. Genus *Paratinocallis*, gen. nov.

Type-species. Paratinocallis corylicola, sp. nov.

The new genus may be defined as follows:-

Abdomen without clusters of spinal setae; spinal setae not arranged in parallel rows and pleural setae absent; marginal setae on anterior segment 2 or 3 in number. First segment of all tarsi with 5 setae. Apical tibial setae strongly differentiated from other tibial setae. Head, thorax, and abdomen without finger-like tubercles. Wings normal. Apterae unknown.

The new genus resembles *Tinocallis* Matsumura in the arrangement of spinal abdominal setae and *Myzocallis* Passerini in the number of marginal setae, but it differs from *Tinocallis* by the absence of finger-like tubercles on body and from *Myzocallis* by the arrangement of spinal abdominal setae. The genus is represented by a single species.

Embryo: Dorsal setae long, capitate; spinal setae variable in length, not arranged in parallel rows; pleural setae absent; marginal setae single. Cornicle visible.

Host plants: Betulaceae. Distribution: Eastern Asia.

1. Paratinocallis corylicola, sp. nov.

Alate viviparous female: Body pale yellow in life. In mounted specimens, head, thorax, and abdomen pale. Antennae pale; 5th and 6th segments pale brown. Legs pale; tibiae at apex and tarsi pale brown. Cornicle and cauda pale. Body about 1.45 mm. in length. Head (fig. 6 A) smooth, with front somewhat roughened, without tubercles; cephalic setae very short, the longest seta 0.4–0.5 as long as middle breadth of 3rd antennal segment. Antennae about 0.7 as long as body; 3rd segment (fig. 6, C) faintly imbricated, with 7–9 secondary sensoria; 4th and following segments more distinctly imbricated; processus terminalis 0.94–1.14 times as long as base of 6th segment; length of 3rd—6th segments in propotion 26:17:13:7.4+7.6. Antennal setae short, at most 1/2 as long as middle breadth of 3rd antennal segment; 3rd segment with 2 or 3 setae. Rostrum extending to midway between fore and middle coxae; ultimate segment (fig. 6, D) slender, about 0.9 as long as 2nd segment of hind tarsus, with 4–5 setae besides apical ones. Thorax without tubercles. Legs: tibiae with spinules on distal 1/2–3/5; 1st tarsal segment with 5 setae. Abdomen: anterior segments with small marginal tubercles bearing 2 or 3 setae. Dorsal abdominal

chaetotaxy as shown in Fig. 6, B; its arrangement of the spinal setae is similar to that of *Tinocallis* Mats. Cornicle truncate, 0.6-0.7 as long as 2nd segment of hind tarsus, at most 5/7 as long as base of 6th antennal segment. Cauda knobbed and anal plate bilobed, both bearing only elongate setae with pointed apices.

Specimens examined: 3 alate viviparous females and 2 alatoid nymphs (syntypes), Sapporo, Hokkaidô, 22-viii-1970, ex *Corylus sieboldiana*, M. Miyazaki leg.

Host plants: Corylus sieboldiana Blume.

Distribution: Japan (Hokkaidô).

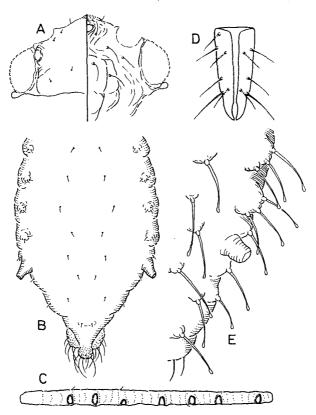

Fig. 6. Paratinocallis corylicola, sp. nov. Alate viviparous female:—
A, head; B, abdomen; C, 3rd antennal segment; D, ultimate rostral segment. Alatoid nymph:—E, right side of abdomen.

6. Genus Recticallis Matsumura

References. Matsumura 1919: 105; Takahashi 1965: 56; Hille Ris Lambers 1965: 194.

Type-species: Recticallis alnijaponicae Matsumura, 1919.

On account of the resemblance of the embryonic chaetotaxy this genus appears to be very closely related to *Pterocallis* Passerini of Europe. It is, however, distinguished from the latter by the presence of well-developed unpaired tubercles in the adult.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 41, K, the setae being long, capitate; spinal setae variable in length, not arranged in parallel rows; pleural setae absent. Cornicle visible.

Host plants: Betulaceae. Distribution: Eastern Asia.

Key to the Japanese species of Recticallis

Alate viviparous female

- 1. Pronotal median tubercle short, 1.3-2.1 times as long as middle breadth of 3rd antennal segment. Third antennal segment colourless except for apical part. Fore wing without patch between veins (fig. 7, C). Body about 1.9 mm. 1. alnijaponicae Matsumura

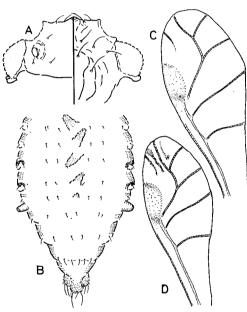

Fig. 7. Recticallis alnijaponicae Matsumura (A-C) and R. nigrostriate (Shinji) (D). Alate viviparous female:—A, head; B, abdomen; C & D, fore wing.

1. Recticallis alnijaponicae Matsumura

References. Matsumura 1919: 106; Shinji, 1935 a: 282 [Agrioaphis moriokae]; ibid. 1941: 364 [Tuberculoides alnifoliae]; ibid. 1941: 1147 [Myzocallis moriokae]; Takahashi 1965: 57.

Synonyms. Agrioaphis moriokae Shinji, 1935; Tuberculoides alnifoliae Shinji, 1941.

Alate viviparous female: Measurements of 10 specimens in mm. Body 1.19 (1.47-2.12); antennal segments (1st-6th): 0.06 (0.05-0.06), 0.06 (0.05-0.06), 0.48 (0.40-0.55), 0.32 (0.25-0.36), 0.28 (0.24-0.32), 0.14(0.12-0.15)+0.11 (0.09-0.12); ultimate rostral segment 0.09 (0.08-0.09); hind femur 0.42 (0.35-0.47); hind tibia 0.78 (0.65-0.86); 2nd segment of hind tarsus 0.10 (0.09-0.11); longest seta on head 0.023 (0.015-0.030), that on 3rd antennal segment 0.009 (0.008-0.011), that on 6th abdominal segment 0.016 (0.014-0.018), that on hind tibiae 0.023 (0.020-0.025).

Specimens examined: Many alate viviparous females taken at the following

localities: Hokkaidô—Sapporo, 1-viii-1960, ex *Alnus japonica*, R. Takahashi leg.; Sôunkyô, 17-vii-1968, ex *Alnus hirsuta*. Honshû—Kaigake, Niigata-ken, 2-vii-1967, ex *Alnus hirsuta*; Ôsaka, 3-v-1959, ex *Alnus* sp., R. Takahashi leg.

Host plants: Alnus firma Sieb. & Zucc. (after Shinji, 1941), Alnus hirsuta Turcz., Alnus hirsuta var. sibirica (Fischer) (after Shinji, 1924), Alnus japonica (Thunb.).

Distribution: Japan (Hakkaidô; Honshû).

This species is very closely related to Recticallis pseudoalni (Takahashi) from Formosa, but it differs from the latter by the number of secondary sensoria and by

the pigmentation of 3rd antennal segment.

2. Recticallis nigrostriata (Shinji)

References. Shinji 1941: 383 [Tuberculoides]; Paik 1965: 40 [Tuberculoides]; Takahashi 1965: 57.

Alate viviparous female: Measurements of 10 specimens in mm. Body 1.68 (1.41–2.03); antennal segments (1st–6th): 0.05 (0.05-0.06), 0.06 (0.05-0.07), 0.44 (0.34-0.51), 0.29 (0.23-0.39), 0.24 (0.20-0.33), 0.12 (0.09-0.14)+0.11 (0.09-0.14); ultimate rostral segment 0.08 (0.08-0.09); hind femur 0.35 (0.27-0.42); hind tibia 0.65 (0.52-0.82); 2nd segment of hind tarsus 0.09 (0.08-0.10); longest seta on head 0.020 (0.015-0.023), that on 3rd antennal segment 0.008 (-), that on 6th abdominal segment 0.016 (0.015-0.017), that on hind tibia 0.023 (0.020-0.027).

Specimens examined: Many alate viviparous females, Utsunomiya, Tochigi-ken, 4–ix–1967, ex *Alnus japonica*; Mt. Tanzawa, Kanagawa-ken, 9–viii–1961, ex *Alnus* sp., R. Takahashi leg.; Asakawa, Tôkyô Distr., 24–vii–1959, ex *Alnus* sp., R. Takahashi leg.; Hirao, Ôsaka, 3–xi–1960, ex *Alnus japonica*, R. Takahashi leg.; Sôja, Okayama-ken, 18–viii–1967, ex *Alnus hirsuta* var. *sibirica*; Mt. Daisen, Tottori-ken, 21–viii–1967, ex *Alnus* sp.

Host plants: Alnus firma Sieb. & Zucc. (after Shinji, 1941), Alnus hirsuta var. sibirica (Fischer), Alnus japonica (Thunb.).

Distribution: Japan (Honshû); Korea.

7. Genus Sappocallis Matsumura

References. Matsumura 1919: 107; Shinji 1941: 127.

Synonyms. *Telocallis* Shinji, 1922 [type-species: *Telocallis alnifoliae* Shinji, 1922]. Type-species. *Sappocallis ulmicola* Matsumura, 1919.

In most respects *Sappocallis* resembles *Tinocallis* Matsumura, being distinguishable from the latter only by the media of the forewing being once-branched. This genus is represented by a single species occurring in Japan.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 41, D, the setae being long, capitate; spinal setae on abdominal segments III, V, and VII show a considerably greater mutual distance than the other spinal setae; pleural setae absent. Cornicle visible.

Host plants: Ulmaceae. Distribution: Eastern Asia.

1. Sappocallis ulmicola Matsumura

References. Matsumura 1919: 108; Shinji 1941: 347; Tao 1963: 63.

Alate viviparous female: Measurements of 10 specimens in mm. Body 1.55 (1.44–1.62); antennal segments (1st–6th): 0.05 (-), 0.05 (0.04–0.05), 0.39 (0.35–0.42), 0.21 (0.17–0.23), 0.20 (0.18–0.23), 0.11 (0.11–0.12)+0.11 (0.08–0.12); ultimate rostral segment 0.10 (0.09–0.11); hind femur 0.37 (0.35–0.39); hind tibia 0.65 (0.61–0.71); 2nd segment of hind tarsus 0.09 (0.07–0.09); longest seta on head 0.011 (0.011–0.015), that on 3rd antennal segment 0.004 (-), that on 6th abdominal segment 0.011 (0.010–0.015), that on hind tibia 0.027 (0.023–0.031).

Specimens examined: Many alatae taken at the following localities: Hokkaidô-

Sapporo, 13-vi-1967, ex *Ulmus davidiana* var. *japonica*; Ônuma, 16-vi-1967, ex *Ulmus davidiana* var. *japonica* f. *suberosa*; Jôzankei, 4-ix-1969, ex *Ulmus* sp. Honshû—Nikkô, Tochigi-ken, 23-vii-1967, ex *Ulmus davidiana* var. *japonica* f. *suberosa*; Tsumagoi, Gumma-ken, 30-vii-1961, ex *Ulmus* sp., R. Takahashi leg.; Tokusawa, Naganoken, 25-vii-1967, ex *Ulmus davidiana* var. *japonica*. 1 alate male, Sapporo, Hokkaidô, 28-ix-1967, ex *Ulmus davidiana* var. *japonica*.

Host plants: Ulmus davidiana var. japonica (Rehd.), and Ulmus davidiana var. japonica f. suberosa Nakai.

Distribution: Japan (Hokkaidô; Honshû; Kyûshû); Formosa.

8. Genus Shivaphis Das

References. Das 1918: 245; Baker 1920: 24; Shinji 1941: 120.

Type-species. Shivaphis celti Das, 1918.

This genus is evidently Oriental, being represented by only a single species.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 41, P, the setae being very short, pointed; pleural setae absent; spinal setae about equal to marginal ones in length. Cornicle visible.

Host plants: Ulmaceae.

Distribution: Oriental region.

1. Shivaphis celti Das

References. Das 1918: 246; Essig & Kuwana 1918: 95 [Chromaphis celticolens]; Takahashi 1919 b: 195 [Phyllaphis celticolens]; ibid. 1921 b: 74; ibid. 1923: 130 [celticolens] & 131; ibid. 1924: 66; Shinji 1927: 10; ibid. 1941: 299; Kanakaraj David 1958: 172; Tao 1963: 38; Paik 1965: 33.

Synonyms. Chromaphis celticolens Essig & Kuwana.

Alate viviparous female: Measurements of 6 specimens in mm. Body 1.93 (1.80–2.28); antennal segments (1st–6th): 0.07 (0.06–0.08), 0.07 (0.07–0.08), 0.53 (0.50–0.56), 0.27 (0.26–0.29), 0.26 (0.25–0.27), 0.20 (0.20–0.21)+0.04 (0.03–0.05); ultimate rostral segment 0.10 (0.09–0.11); hind femur 0.67 (0.62–0.82); hind tibia 1.02 (0.92–1.20); 2nd segment of hind tarsus 0.13 (0.11–0.15); longest seta on head 0.033 (0.023–0.046), that on 3rd antennal segment 0.012 (0.006–0.015), that on 6th abdominal segment 0.040 (0.034–0.054), that on hind tibia 0.042 (0.030–0.049).

Apterous viviparous female: Measurements of 5 specimens in mm. Body 2.46 (2.31-2.58); antennal segments (1st-6th): 0.07 (0.07-0.08), 0.07 (--), 0.42 (0.41-0.43), 0.19 (0.18-0.19), 0.20 (0.20-0.21), 0.16 (0.15-0.17)+0.03 (--); ultimate rostral segment 0.10 (0.09-0.10); hind femur 0.58 (0.56-0.59); hind tibia 0.86 (0.80-0.91); 2nd segment of hind tarsus 0.15 (0.14-0.15); longest seta on head 0.038 (--), that on 3rd antennal segment 0.014 (0.011-0.015), that on 6th abdominal segment 0.040 (0.036-0.054), that on hind tibia 0.040 (0.034-0.052).

Specimens examined: Many alate viviparous females, Tôkyô, 23-vii-1960, ex Celtis sp., R. Takahashi leg.; Hôya Tôkyô, 12-v-1969, ex Celtis sinensis var. japonica, H. Takizawa leg.; Utsunomiya, Tochigi-ken, 20-v-1966, ex Celtis sinensis var. japonica; Nagano, Ôsaka, 3-v-1959, ex Celtis sinensis, R. Takahashi leg.; Kôchi, Kôchi-ken, 15-v-1966, ex Celtis sinensis var. japonica. Some apterous viviparous females, Hôya, Tôkyô, 12-v-1969, H. Takizawa leg.; Kôchi, Kôchi-ken, 15-v-1966.

Host plants: Celtis sinensis var. japonica (Planch.). In India Celtis tetrandra var. hamiltonii has been recorded as its host (after Kanakaraj David, 1958).

Distribution: Japan (Honshû; Shikoku; Kyûshû); Korea; Formosa; China; India; Ceylon.

This species is distinct by the body covered with wax dust and by the host relationship.

9. Genus Takecallis Matsumura

References. Matsumura 1917: 373; Cottier 1953: 87; Hille Ris Lambers 1965: 202; Eastop 1966: 519; Higuchi 1968: 25.

Type-species. (*Takecallis bambusae* Matsumura, 1917) = *Takecallis arundicolens* (Clarke, 1903).

So far as my previous revision (1968) is concerned, this genus is represented by four species, of which the origins are apparently considered to be Oriental.

Embryo: Dorsal abdominal chaetotaxy as shown in Figs. 41, M & N, the setae being long, capitate; spinal setae arranged in parallel rows; pleural setae absent. Cornicle visible.

Host plants: Bambusaceae.

Distribution: Holarctic, Oriental and Australian regions.

Key to the Japanese species of Takecallis

Alate viviparous female

- 3. Secondary sensoria arranged on basal 1/2 of 3rd antennal segment. Anterior abdominal segments bearing at least 4 dorsal setae excluding marginal ones. . . 3. sasae (Matsumura)
- Secondary sensoria arranged on basal 1/3 of 3rd antennal segment. Each abdominal segment bearing 2 dorsal setae excluding marginal ones. 4. taiwanus (Takahashi)

1. Takecallis arundicolens (Clarke)

References. Clarke 1903: 249 [Callipterus]; Matsumura 1917: 373 [bambusae]; Swain 1919: 22 [Myzocallis]; Takahashi 1926: 159 [Myzocallis]; Theobald 1927: 341 [Myzocallis]; Shinji 1941: 306 [Myzocallis]; Hille Ris Lambers 1947: 658; Börner 1952: 60; Tao 1963: 59; ibid, 1964a: 220; Stroyan 1964: 34; Paik 1965: 49; Hille Ris Lambers 1965: 202; Eastop 1966: 520; Higuchi 1968: 25.

Synonyms. Takecallis bambusae Matsumura, 1917.

Host plants: Phyllostachys sp., Sasa nipponica (Makino), Sasa palmata (Bean), and Sasa senanensis (Franch. & Sav.).

Distribution: Japan; Korea; Formosa; Europe; North America.

2. Takecallis arundinariae (Essig)

References. Essig 1917: 302 [Myzocallis]; Takahashi 1921 b: 73 [Myzocallis bambucifoliae (sic)];

Swain 1919: 24 [Myzocallis]; Takahashi 1926: 159 [Myzocallis]; ibid. 1931: 84 [Agrioaphis bambusi-foliae]; Börner 1952: 60; Tao 1963: 59; ibid. 1964: 220; Stroyan 1964: 34; Hille Ris Lambers 1965: 202; Takahashi 1965: 58; Paik 1965: 49 [Takecallis sasacola]; Eastop 1966: 520; Higuchi 1968: 27.

Synonyms. Myzocallis bambusifoliae Takahashi, 1921.

Host plants: Bamboo (in Japan after Takahashi, 1926); Arundinaria graminea, A. japonica, Phyllostachys dulcis, P. castillonis and P. viridiglaucescens (in England after Stroyan, 1964).

Distribution: Japan; Korea; Formosa; Europe; North America.

3. Takecallis sasae (Matsumura)

References. Matsumura 1917: 372 [Myzocallis]; Takahashi 1926: 160 [Myzocallis]; Shinji 1935: 285 [Agrioaphis sasacola]; ibid. 1941: 322 [Myzocallis], 1150 [Myzocallis sasacola]; Hille Ris Lambers 1965: 202; Takahashi 1965: 58 (partim); Higuchi 1968: 29.

Synonyms. Agrioaphis sasacola Shinji, 1935.

Host plants: *Phyllostachys* sp., *Sasa nipponica* (Makino), *Bambusa* sp. (after Takahashi, 1926), and *Sasa senanensis* (Franch. & Sav.) (after Matsumura, 1917).

Distribution: Japan (Hokkaidô; Honshû).

4. Takecallis taiwanus (Takahashi)

References. Takahashi 1925: 46 [Myzocallis sasae]; ibid. 1926: 160 [Myzocallis]; Theobald 1927: 343 [Myzocallis arundinariae]; Takahashi 1931; 84 [Agrioaphis]; Tissot 1932: 11 [Therioaphis tectae]; Cottier 1953: 87 [arundinariae]; Tao 1963: 60; ibid. 1964a: 220 [sasae]; Stroyan 1964: 34; Hille Ris Lambers 1965: 202; Eastop 1966: 520; Higuchi 1968: 30.

Synonyms. Therioaphis tectae Tissot, 1932.

Host plants: Sasa sp. (in Japan after Higuchi, 1968); Arundinaria anceps, A. gigantea, Phyllostachys dulcis, P. nigra and P. castukkinis (in England after Stroyan, 1964).

Distribution: Japan; Formosa; New Zealand; Europe; North America.

Having examined the paratype of *Therioaphis tectae* Tissot, 1932, from Florida (14-iv-1930) I have come to the conclusion that *tectae* should be suppressed as a synonym of *taiwanus* as Hille Ris Lambers (1965) already pointed out.

10. Genus *Tiliaphis* Takahashi

References. Takahashi 1961 b: 251.

Type-species. Therioaphis shinae Shinji, 1924.

In most respects this genus appears to be extremely like *Eucallipterus* Schouteden, 1906, which occurs on various plants of *Tilia* L. in Europe and North America, but in Asia *Tiliaphis* is most easily recognized by the distinctive body colour and by the host relationship. It is too early to discuss the relationship between *Tiliaphis* and *Eucallipterus* exactly, since further examinations of Asiatic species are necessary.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 41. G, the setae being long, capitate; spinal setae variable in length, not arranged in parallel rows; pleural setae absent. Cornicle visible.

Host plants: Tiliaceae.

Distribution: Eastern Asia.

Key to the Japanese species of Tiliaphis

Alate viviparous female

- 1. Abdomen (fig. 8, B) with a pair of brown patches on each segment. Third antennal segment (fig. 8, D) about 2.6 times as long as base of 6th antennal segment, with 8-11 (mostly 9) secondary sensoria on basal 1/3. Sixth antennal segment with processus terminalis 0.9-1.2 times as long as base of the segment. Ultimate rostral segment 1.3-1.5 times as long as 2nd seg-Abdomen without brown patches as above. Third antennal segment (fig. 8, E) about 1.9 times as long as base of 6th antennal segment, with 10-17 (mostly 14) secondary sensoria on basal 2/3. Sixth antennal segment with processus terminalis 1.2-1.4 times as long as base of
- the segment. Ultimate rostral segment 1.0-1.1 times as long as 2nd segment of hind tarsus.

1. Tiliaphis shinae (Shinji)

References. Shinji 1924: 346 [Therioaphis]; ibid. 1933 c: 165 [Therioaphis japonica]; ibid. 1941; 353 [Therioaphis japonica]; Takahashi 1961 b: 251; Paik 1965: 47 [Therioaphis japonica].

Synonyms. Therioaphis japonica Shinji, 1933. Syn. nov.

Only the alate viviparous female of the species has hitherto been described. On the basis of the present specimens brief descriptions of the male and oviparous female are given as follows:-

Alate male: Much like the alate viviparous female, differing in the following aspects:—Body smaller, about 1.5 mm. in length. Head and abdomen with dorsal setae shorter than in apterae. Antennae about 0.9 as long as body; 3rd segment with 19-22 secondary sensoria along whole length, 4th with 5 or 6, 5th with 4 or 5, and 6th with 2 or 3; length of 3rd-6th segments in proportion 28:16:16:11.5+16. Cornicles smaller.

Oviparous female: Differs from the alate viviparous female as follows:—Body larger and not slender, about 1.8 mm. in length. Head, thorax, and abdomen with dorsal setae longer than in apterae, all the setae being capitate. Hind tibiae with 70 or more pseudosensoria along whole length. Cornicles large, about 1.6 times as long as 2nd segment of hind tarsus, about 1.5 times as long as ultimate rostral segment.

Table 2. Chaetotactic data for Tiliaphis shinae (Shinji). Measurements of maximal setae in micra:

Morph	Head	Abdomen (6th seg.)
Alate viviparous female	46–62 av. 53	53- 62 av. 56
Alate male	19	32
Oviparous female	57–95 av. 76	99-114 av. 106

Specimens examined: Some alate viviparous females, Misumai, Hokkaidô, 24-vi-1968, ex Tilia maximowicziana; Iwamizawa, Hokkaidô, 7-vii-1968, ex Tilia sp.; Morioka, Iwate-ken, 4-viii-1960, ex *Tilia japonica*, R. Takahashi leg. 1 alate male

and some oviparous females, Misumai, Hokkaidô, 2-x-1967, ex Tilia maximowicziana.

Host plants: Tilia japonica (Miq.), Tilia maximowicziana Shirasawa, Tilia miqueliana Maxim. (after Shinji, 1933). In Korea Tilia insularis, T. amurensis var. borbigera, and T. amurensis var. glabrata have been recorded as hosts (after Paik, 1965).

Distribution: Japan (Hokkaidô; Honshû); Korea.

Having read the original description of *Therioaphis japonica* Shinji, 1933, I have been convinced that this should be suppressed as a synonym of *shinae*.

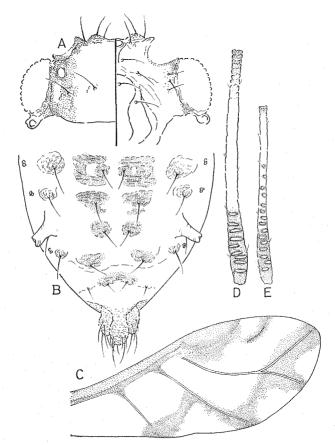

Fig. 8. Tiliaphis shinjii, sp. nov. (A-D) and T. shinae (Shinji) (E). Alate viviparous female:—A, head; B, abdomen, C, fore wing; D & E, 3rd antennal segment.

2. Tiliaphis shinjii, sp. nov.

References. Shinji 1933 c: 162 [Therioaphis shinae]; ibid. 1941: 355 [Therioaphis shinae].

Therioaphis shinae Shinji (1933 & 1941) is different from shinae Shinji, 1924, but seems to be identical with the present new species.

Alate viviparous female: Body colour in life unknown. In mounted specimens

head (fig. 8, A) and thorax with a brown stripe on either side. Antennae: 1st-2nd segments, 3rd segment on basal 1/3, and 3rd-5th segments at apex brown. Legs pale; tarsi brown. Abdomen (fig. 8, B) with two rows of brown patches." Body about 2.0 mm. in length. Antennal tubercles not well developed. Antennae very slender, as long as body; 1st segment much convex on inner side; 3rd segment (fig. 8, D) about 2.6 times as long as base of 6th antennal segment, with 8-11 transversely elongate sensoria on basal 1/3; one or 2 accessory sensoria a little isolated from primary one; processus terminalis as long as base of 6th antennal segment; length of 3rd-6th segments in proportion 39:24:24:15+16. Clypeus with a pair of anterior setae; mandibular lamina with a seta about equal to cephalic setae. Rostrum short, not reaching middle coxae; ultimate segment about 1.4 times as long as 2nd segment of hind tarsus, with 2-4 secondary setae besides primary ones. Pronotum with 1 anterior spinal seta, 1 posterior spinal seta, and 0 or 1 posterior marginal seta on either side, all prothoracic setae long, about equal to posterior cephalic setae. Legs: fore coxae much enlarged; femora with some short setae; tibiae with spinules on apical 1/3 or more; 1st segment of all tarsi with 5 setae ventrally and 2 setae dorsally. Abdomen with a pair of brown patches on each segment and small blunt marginal tubercles on anterior segments. Dorsal abdominal chaetotaxy and pigmentation as shown in Fig. 8, B. Cornicles smooth, long, a little longer than 2nd segment of hind tarsus, expanded at base, without flange. Cauda with about 12 long setae. Anal plate deeply bilobed. Genital plate with about 6 setae along hind margin. Wing (fig. 8, C): media with a branch; radial sector normal (not short). Measurements of maximal setae in micra as follows:—head 51 (45-62), antenna (3rd seg.) 13 (12-15), abdomen (6th seg.) 58 (46-68), leg (hind tibia) 32 (28-39).

Specimens examined: Some alate viviparous females (syntypes), Sugadaira, Naganoken, 29-vii-1961, ex *Tilia* sp., R. Takahashi leg.

Host plants: Tilia japonica (Miq.) (after Shinji, 1933), Tilia sp.

Distribution: Japan (Honshû).

11. Genus *Tinocallis* Matsumura

References. Matsumura 1919: 100; Richards 1965: 98; ibid. 1967: 537; Eastop 1966: 522.

Synonyms. Melanocallis Oestlund, 1922 [type-species: Callipterus caryaefoliae Davis, 1910]; Sarucallis Shinji, 1922 [type-species: (Sarucallis lythrae Shinji, 1922) = Tinocallis kahawaluokalani (Kirkaldy)]; Lutaphis Shinji, 1924 [type-species: (Lutaphis nirecola Shinji, 1924) = Tinocallis zelkowae (Takahashi)]; Tuberocallis Nevsky, 1929 [type-species: Tuberocallis saltans Nevsky, 1929].

Type-species. Tinocallis ulmiparvifoliae Matsumura, 1919.

This genus is closely related to *Myzocallis* Passerini, but it differs from the latter by the arrangement of the dorsal abdominal setae. The spinal setae on the abdominal segments III, V and VII are displaced laterally both in the adult and in the embryo.

Embryo: Dorsal abdominal chaetotaxy as shown in Figs. 41, E & F, the setae being capitate; spinal setae on abdominal segments III, V and VII show a considerably greater mutual distance than the other spinal setae; pleural setae absent. Cornicle visible.

Host plants: Ulmaceae, Betulaceae, Sapindaceae and Lythraceae.

Distribution: Holarctic, Oriental, Neotropical and Australian regions.

Key to the Japanese species of Tinocullis

	Alate viviparous female
1.	Mesonotum with spinal tubercles
-	Mesonotum without spinal tubercles
2.	Spinal tubercles on mesonotum shorter than 2nd antennal segment
-	Spinal tubercles on mesonotum as long as or longer than 2nd antennal segment 4
3.	Pronotum with 2 pairs of spinal tubercles. Third antennal segment (fig. 9, C) with 6-9 sec-
	ondary sensoria. On Sapindus spp 1. insularis (Takahashi)
_	Pronotum with a pair of spinal tubercles which are sometimes obsolete. Third antennal
	segment (fig. 10, C) with 15-19 secondary sensoria. On Corylus spp
4.	Third antennal segment (fig. 11, C) with 10-13 secondary sensoria and 3 or 4 setae. Abdominal
	segments III-VII without spinal tubercles. Body small, at most 1.25 mm. On Ulmus spp.
-	Third antennal segment with 16-24 secondary sensoria and 9-19 setae. Abdominal segments
	III-VII with small spinal tubercles. Body large, at least 1.76 mm 5
5.	Head with finger-like tubercles. Pronotum with 2 pairs of spinal tubercles. Ultimate rostral
	segment 0.75-0.85 as long as 2nd segment of hind tarsus, with 4 or 5 secondary setae. First
	tarsal segment with 5 or 6 setae ventrally. On Ulmus spp
-	Head (fig. 12, A) without finger-like tubercles. Pronotum with a pair of spinal tubercles.
	Ultimate rostral segment (fig. 12, D) 0.94-1.14 times as long as 2nd segment of hind tarsus,
	with 6-10 secondary setae. First tarsal segment (fig. 12, E) with 7 setae ventrally. On
	Ulmus spp
6.	Spinal tubercles on 2nd abdominal segment longer than 2nd antennal segment. Third an-
	tennal segment with 5-9 secondary sensoria. Cornicle brown. On Lagerstroemia spp
	2. kahawaluokalani (Kirkaldy)
_	Spinal tubercles on 2nd abdominal segment shorter than 2nd antennal segment. Third antennal
	segment with 13-18 secondary sensoria. Cornicle pale. On Zelkova spp

1. Tinocallis insularis (Takahashi), comb. nov.

References. Takahashi 1927: 9 [Myzocallis]; ibid. 1931: 83 [Myzocallis]; Tao 1963: 67 [Sarucallis].

This species is new to Japan. On the basis of the specimens examined a redescription is given below:—

Alate viviparous female: Body colour in life unknown. In mounted specimens head and thorax pale. Antennae pale; 3rd-5th segments at apex and 6th segment at middle fuscous. Legs pale. Abdomen (fig. 9, B) with a pair of dusky spots on 3rd and following segments. Cornicles and cauda pale. Body about 1.48 mm. in length. Head (fig. 9, A) smooth, with very small tubercles which are sometimes obsolete; cephalic setae 0.5-0.75 as long as middle breadth of 3rd antennal segment. Antennae 0.74 as long as body; 3rd segment (fig. 9, C) faintly spiculosely imbricated, with 6-9 (mostly 7) secondary sensoria on thickening part; processus terminalis 0.9-1.0 times as long as base of 6th antennal segment; length of 3rd-6th segments in proportion 24:14:13:8+7. Antennal setae at most 3/4 as long as middle breadth of 3rd antennal segment; 3rd segment with 3-5 setae. Clypeus with a pair of anterior setae;

mandibular lamina with a seta 3.4–5.8 times as long as cephalic setae. Rostrum not reaching middle coxae; ultimate segment (fig. 9, E) 0.8–1.0 times as long as 2nd segment of hind tarsus, with 8–10 setae including apical ones. Pronotum with 2 pairs of spinal tubercles, the tubercles being at most 16 μ in length. Prothoracic setae 8 in number and about equal to cephalic ones in length. Mesonotum with a pair of small tubercles. Legs: tibiae with spinules on distal 1/3–1/2; 1st tarsal segment with 5 setae ventrally and 2 setae dorsally. Abdomen with 1st and 2nd segments bearing a pair of large spinal tubercles; 3rd–7th segments sometimes with a pair of small spinal tubercles about equal to prothoracic spinal ones. Dorsal abdominal chaetotaxy and pigmentation as shown in Fig. 9, B. Marginal tubercles present on anterior segments, the tubercles situated in the marginal sclerites. Cornicles smooth, 0.3–0.4 as long as 2nd segment of hind tarsus, at most 1/3 as long as base of 6th antennal

segment, without flange. Cauda knobbed and anal plate bilobed, both bearing only elongate setae with pointed apices.

Specimens examined: Some alate viviparous females taken at Tôkyô, 3-viii-1957, 22-vii-1959, ex *Sapindus* sp., R. Takahashi leg.

Host plants: *Sapindus* sp. In Formosa *Sapindus mukurossi* has been recorded as host (after Takahashi, 1927).

Distribution: Japan (Honshû); Formosa; China.

2. **Tinocallis kahawaluokalani** (Kirkaldy)

References. Kirkaldy 1907: 10 [Myzocallis]; Takahashi 1920: 118 [Monellia lagerstroemiae]; ibid. 1921 b: 74 [Callipterus]; ibid. 1923: 44 [Callipterus]; Shinji 1922: 731 [Sarucallis lythrae]: ibid. 1941: 311 [Myzocallis]; Tao 1963: 68 [Sarucallis]; Paik 1965: 52 [Sarucallis]; Calilung 1967: 119 [Sarucallis]; Richards 1967: 540.

Synonyms. Monellia lagerstroemiae Takahashi, 1920; Sarucallis lythrae Shinji, 1922.

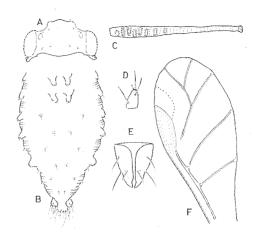

Fig. 9. Tinocallis insularis (Takahashi).

Alate viviparous female:—A,
head; B, abdomen; C, 3rd antennal segment; D, 1st segment
of hind tarsus (lateral view); E,
ultimate rostral segment; F,
fore wing.

Alate viviparous female: Measurements of 10 specimens in mm. Body 1.35 (1.02–1.80); antennal segments (1st-6th): 0.05 (0.04–0.06), 0.05 (0.04–0.05), 0.30 (0.22–0.42), 0.21 (0.14–0.27), 0.19 (0.15–0.27), 0.12 (0.09–0.14)+0.11 (0.09–0.12); ultimate rostral segment 0.08 (0.07–0.09); hind femur 0.29 (0.23–0.39); hind tibia 0.50 (0.39–0.73); 2nd segment of hind tarsus 0.08 (0.06–0.09); cornicle 0.03 (0.03–0.05); longest seta on head 0.008 (0.008–0.011), that on 3rd antennal segment 0.004 (– –), that on 6th abdominal segment 0.008 (0.004–0.011).

Specimens examined: Many alate viviparous females taken at the following localities: Honshû—Utsunomiya, Tochigi-ken, 17-viii-1967, ex *Lagerstroemia indica*; Tôkyô, 16-viii-1964, ex *Lagerstroemia indica*, M. Miyazaki leg.; Nagano, Ôsaka, 3-v-1959, ex *Lagerstroemia* sp., R. Takahashi leg. Shikoku—Kôchi, Kôchi-ken, 15-v-1966, ex *Lagerstroemia indica*; Ryûkyû—Naha, Okinawa, ex *Lagerstroemia* sp., K. Iha leg.

Host plants: Lagerstroemia indica L.

Distribution: Japan (Honshû; Shikoku; Kyûshû; Ryûkyû); Korea; Formosa; China; Philippines; Hawaii; North America.

This species is readily distinguished from any other Japanese species by its host relationship, by the distinctive colouration, and by the second abdominal segment with the largest abdominal tubercles.

3. Tinocallis nikkoensis, sp. nov.

Alate viviparous female: Head, thorax and abdomen pale yellow. Antennae and legs pale yellow or dirty yellow. Body about 1.47 mm. in length. Head (fig. 10, A) smooth, with front somewhat roughened, without tubercles on dorsum; cephalic setae short, the longest seta 0.40-0.68 as long as middle breadth of 3rd antennal segment.

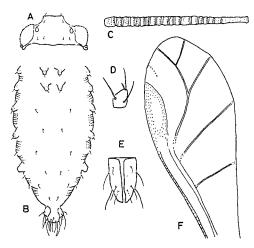

Fig. 10. Tinocallis nikkoensis, sp. nov. Alate viviparous female:—A, head; B, abdomen; C, 3rd antennal segment; D, 1st segment of hind tarsus (lateral view); E, ultimate rostral segment; F, fore wing.

Antennae about 0.70 as long as body; 3rd segment (fig. 10, C) spiculosely imbricated, with 15-19 (mostly 18) secondary sensoria; processus terminalis 0.82-1.33 times as long as base of 6th antennal segment; length of 3rd-6th segments in proportion 25:11: 12:7+7. Antennal setae short, at most 1/2 as long as middle breadth of 3rd antennal segment; 3rd segment with 1-4 (mostly 3) setae. Clypeus with a pair of anterior setae; mandibular lamina with a seta 4.6-6.2 times as long as cephalic setae. Rostrum extending to midway between fore and middle coxae; ultimate segment (fig. 10, E) 0.63-0.84 as long as 2nd segment of hind tarsus, with 4 setae besides apical ones. Pronotum sometimes with a pair of spinal tubercles at most 1/4 as long as those on 1st abdominal segment; prothoracic setae subequal to cephalic setae Mesonotum with a pair of in length. spinal tubercles as large as marginal ones on 3rd abdominal segment. Legs: tibiae

with spinules on distal 1/4-1/3; 1st tarsal segment with 5 setae ventrally and 2 setae dorsally. Abdomen with 1st and 2nd segments bearing a pair of large spinal tubercles. Dorsal abdominal chaetotaxy as shown in Fig. 10, B; the marginal seta of 6th segment not attached to the base of cornicle. Cornicles 0.2-0.3 as long as 2nd segment of hind tarsus, at most 1/4 as long as base of 6th antennal segment. Cauda knobbed and anal plate bilobed, both bearing only elongate setae with pointed apices.

Specimens examined: Some alate viviparous females (syntypes) taken at the following localities in Honshû: Shirabutakayu, Yamagata-ken, 29-vi-1967, ex Corylus sieboldiana; Oku-kinu (Nikkô), Tochigi-ken, 11-, 12-vii-1967, ex Corylus heterophylla.

Host plants: Corylus heterophylla Fischer and Corylus sieboldiana Blume.

Distribution: Japan (Honshû).

In the number of secondary sensoria this species resembles *T. zelkowae* (Takahashi), but it differs from the latter in having a pair of large tubercles on mesonotum. The new species is distinct by the body colour, by the shape of tubercles, and by the host relationship.

4. Tinocallis sapporoensis, sp. nov.

Alate viviparous female: Body colour in life unknown. In mounted specimens head and thorax dark brown. Antennae pale; 1st segment dark brown. Abdomen with a pair of spots on each segment. Fore wings (fig. 11, F) hyaline. Body about 1.19 mm. in length. Head (fig. 11, A) without tubercles on dorsum; cephalic setae short, the longest seta 0.20–0.50 as long as middle breadth of 3rd antennal segment. Antennae about 0.75 as long as body; 3rd segment (fig. 11, C) around sensoria spiculosely imbricated, with 10–12 secondary sensoria; processus terminalis 1.0–1.3 times

as long as base of 6th antennal segment; length of 3rd-6th segments in proportion 21:11:10:6+7. Antennal setae at most 1/4 times as long as middle breadth of 3rd antennal segment; 3rd segment with 3 or 4 setae. Rostrum extending to midway between fore and middle coxae; ultimate segment (fig. 11, E) 0.7-1.0 times as long as 2nd segment of hind tarsus, with 4-6 setae besides apical ones. Pronotum with 2 pairs of spinal tubercles, the hind pair being slightly larger than the frontal one. Mesonotum with a pair of large spinal tubercles which are similar to those of ulmiparvifoliae Matsumura in shape. Metanotum without tubercles. Legs: tibiae with spinules on distal 3/13; 1st tarsal segment with 5 setae ventrally and 2 setae dorsally. Abdomen with 1st-2nd segments bearing a pair of spinal tubercles. Dorsal abdominal chaetotaxy as shown in Fig. 11, B. Anterior segments

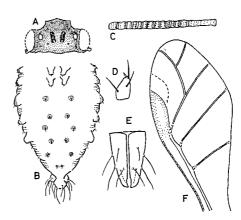

Fig. 11. Tinocallis sapporoensis, sp. nov.

Alate viviparous female:—A,
head; B, abdomen; C, 3rd antennal segment; D, 1st segment of hind tarsus (lateral
view); E, ultimate rostral segment; F, fore wing.

with marginal tubercles, of which those on 2nd and 3rd segments are especially large. Cornicles 0.33-0.40 as long as 2nd segment of hind tarsus, at most 4/11 as long as base of 6th antennal segment. Cauda knobbed and anal plate bilobed, both bearing only elongate setae with pointed apices.

Length of spinal tubercles on thorax and abdomen as follows:-

prothorax		mesothorax	abo	domen
ant.	post.		1st seg.	2nd seg.
8-11	15-23	68-83	46-57	47–64 (μ)

Specimens examined: 3 alate viviparous females (syntypes), Sapporo, Hokkaidô, 31-vii-, 1-viii-1960, ex *Ulmus* sp., R. Takahashi leg.

Host plants: Ulmus sp.

Distribution: Japan (Hokkaidô).

This species is characterized by the following features:—(1) Fore wings hyaline. (2) Head and thorax black. (3) Head without tubercles. (4) Abdominal spinal tubercles present on 1st and 2nd segments. (5) Largest spinal tubercle situated on mesonotum.

5. Tinocallis takachihoensis, sp. nov.

Alate viviparous female: Head and thorax black. Eyes reddish brown. Antennae pale; 3rd-5th segments at apex black. Abdomen pale green. Legs—fore and middle legs: tibiae at apex and tarsi black; hind legs: femora at apex, tibiae at both ends and tarsi black. Body about 1.92 mm. in length. Head (fig. 12. A) faintly corrugated,

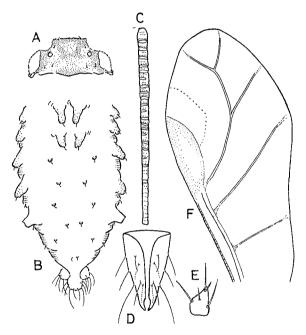

Fig. 12. Tinocallis takachihoensis, sp. nov. Alate viviparous female:—
A, head; B, abdomen; C, 3rd antennal segment; D, ultimate rostral segment; E, 1st segment of hind tarsus (lateral view); F, fore wing.

without tubercles on dorsum; cephalic setae short, the longest seta 0.45-0.83 as long as middle breadth of 3rd antennal segment. Antennae 0.88 as long as body: 3rd segment (fig. 12, C) spiculosely imbricated, with 19-24 (mostly 22) secondary sensoria; processus terminalis 0.92-1.2 times as long as base of 6th antennal segment; length of 3rd-6th segments in proportion 39:23:21:11+11. Antennal setae short, at most 1/2 as long as middle breadth of 3rd antennal segment; 3rd segment with 9-15 (mostly 14) setae. Clypeus with a pair of anterior setae; mandibular lamina with 1 or 2 setae 3.5-4.2 times as long as cephalic setae. Rostrum extending to midway between fore

and middle coxae; ultimate segment (fig. 12, D) 0.94-1.14 times as long as 2nd segment of hind tarsus, with 6-10 setae besides apical ones. Pronotum with a pair of posterior spinal tubercles; prothoracic setae blunt or faintly capitate, as long as or a little longer than cephalic setae. Mesonotum with a pair of large spinal tubercles which are similar to those of *ulmiparvifoliae* Matsumura in shape. Legs: tibiae with spinules on distal 1/6; 1st tarsal segment with 7 setae ventrally and 2 setae dorsally. Abdomen with each segment bearing a pair of spinal tubercles, of which those on 1st and 2nd segments are especially large, at least 2.5 times as large as the rest, while those of 5th and following segments are often small and inconspicuous. Dorsal abdominal chaetotaxy as shown in Fig. 12, B; the marginal seta of 6th segment attached to the base of cornicle. Cornicles a little constricted at middle, 0.4-0.6 as long as 2nd segment of hind tarsus, at most 2/5 as long as base of 6th antennal segment. Cauda knobbed and anal plate bilobed, both bearing only elongate setae with pointed apices.

Specimens examined: Some alate viviparous females (syntypes), Takachiho, Miyazaki-ken, 1-v-1965, ex *Ulmus* sp.

Host plants: Ulmus sp.

Distribution: Japan (Kyûshû).

This species is readily distinguished from any other related ones by the following characters: (1) Antennae about 0.9 as long as body. (2) Third antennal segment with 19-24 secondary sensoria and 9-15 setae. (3) Ultimate rostral segment with 6-10 secondary setae. (4) First tarsal segment with 7 ventral setae.

6. Tinocallis ulmiparvifoliae Matsumura

References. Matsumura 1919: 101; Takahashi 1929: 252 [Myzocallis viridis]; Tao 1963: 61; Eastop 1966: 522; Richards 1967: 548.

Synonyms. Myzocallis viridis Takahashi, 1929.

Alate viviparous female: Measurements of 8 specimens in mm. Body 2.01 (1.75–2.12); antennal segments (1st–6th): 0.07 (0.07–0.08), 0.05 (--), 0.53 (0.48–0.58), 0.26 (0.18–0.32), 0.27 (0.19–0.30), 0.17 (0.13–0.19)+0.13 \cdot (0.08–0.15); ultimate rostral segment 0.09 (0.08–0.09); hind femur 0.49 (0.44–0.53); hind tibia 0.88 (0.79–0.97); 2nd segment of hind tarsus 0.12 (0.10–0.12); cornicle 0.05 (0.05–0.06); longest seta on head 0.011 (0.008–0.015), that on 3rd antennal segment 0.004 (--), that on 6th abdominal segment 0.011 (0.008–0.015).

Specimens examined: Some alate viviparous females, Tôkyô, 27-vii-1955, 15-v-1959, ex *Ulmus* sp., R. Takahashi leg.

Host plants: *Ulmus parvifolia* Jacq. (after Matsumura, 1919), *Ulmus* sp. According to the literature the following plants are recorded as hosts:—*Ulmus chinensis* (in Australia, after Eastop, 1966), *Zelkova formosana* (in Formosa, after Tao, 1963).

Distribution: Japan (Honshû); Formosa; Australia.

This species is easily distinguished from any other congeneric ones by the presence of three pairs of elongate tubercles on the head.

7. Tinocallis zelkowae (Takahashi)

References. Takahashi 1919: 173 [Myzocallis]; Shinji 1924: 347 [Lutaphis nirecola]; ibid. 1941: 320 [Myzocallis nirecola]; Tao 1963: 69 [Sarucallis]; Paik 1965: 51 [Sarucallis]; Richards 1967: 550.

Synonyms. Lutaphis nirecola Shinji, 1924.

Alate viviparous female: Measurements of 10 specimens in mm. Body 1.62 (1.41-1.72); antennal segments (1st-6th): 0.05 (0.05-0.06), 0.05 (0.04-0.05), 0.36 (0.30-0.40), 0.20 (0.17-0.22), 0.19 (0.15-0.21), 0.12 (0.11-0.14)+0.08 (0.06-0.09); ultimate rostral segment 0.08 (--); hind femur 0.33 (0.29-0.41); hind tibia 0.53 (0.47-0.61); 2nd segment of hind tarsus 0.08 (0.07-0.09); cornicle 0.03 (--); longest seta on head 0.012 (0.008-0.015), that on 3rd antennal segment 0.004 (--), that on 6th abdominal segment 0.008 (0.008-0.011).

Specimens examined: Many alate viviparous females taken at the following localities: Honshû—Morioka, Iwate-ken, 24-vi-1967, ex *Zelkova serrata*; Utsunomiya, Tochigi-ken, 17-viii-1967, ex *Zelkova serrata*; Nikkô, Tochigi-ken, 21-vii-1967, ex *Zelkova serrata*; Tôkyô, 8-viii-1958, ex *Zelkova* sp., R. Takahashi leg.; Ôsaka, 31-v-

1959, ex Zelkova sp., R. Takahashi leg. Shikoku—Sadamitsu, Tokushima-ken, 19-vii-1958, ex Zelkova sp., R. Takahashi leg.

Host plants: Zelkova serrata (Thunb.), Ulmus davidiana var. japonica (Rehd.) (after Shinji, 1924). According to the literature the following plants are recorded as hosts:—Zelkova formosana (in Formosa, after Tao, 1963); Alnus japonica, Corylus sieboldiana, Robinia pseudoacacia (in Korea, after Paik, 1965).

Distribution: Japan (Hokkaidô; Honshû; Kyûshû; Shikoku); Korea; Formosa.

This species is readily distinguished from any other congeneric ones by its coloration and by the absence of well developed dorsal tubercles as indicated in Figs. 12, A & B. Furthermore, *Tinocallis zelkovae* Dzhibladze, 1957, from Eurasia is a different species.

12. Genus Tuberculatus Mordwilko

References. Mordwilko 1894: 136; Richards 1965: 66; ibid. 1968a: 562; Higuchi 1969: 111.

Synonyms. Acanthocallis Matsumura, 1917 [type-species: A, headomen. Acanthocallis quercicola Matsumura, 1917]; Arakawana domen. Matsumura, 1917 [type-species: Arakawana stigmata Matsumura, 1917].

Type-species. Aphis quercea Kaltenbach, 1843.

This genus is widely distributed in the Holarctic region, including about 20 species. In my previous paper (1969) 9 species are recognized in Japan.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 41, O, the setae being long, capitate; spinal setae arranged in parallel rows; pleural setae absent. Cornicle visible.

Host plants: Fagaceae.

Distribution: Holarctic region.

Key to the Japanese species of Tuberculatus

	Alate viviparous female
1.	Pronotum without spinal tubercles
-	Pronotum with spinal tubercles

Fig. 13.

Tinocallis zelkowae
(Takahashi). Alate
viviparous female:—
A, head; B, abdomen.

۷.	setae. Abdominal segments I-III with a pair of spinal tubercles which are not united on basal part, the tubercles on 3rd segment being sometimes much smaller than the rest
_	Head with frontal and anterior discal setae pointed. Pronotum with 4-16 posterior spinal
	setae. Abdominal segments I-III with a pair of spinal tubercles which are united and ex-
	panded on basal part, the tubercles on 3rd segment being much larger than the rest 3
3.	Stigma with a conspicuously pigmented crescent patch posteriorly. Eyes rather small.
	Frontal tubercles well developed. Frontal setae shorter than 1st and 2nd antennal segments
	taken together. Third antennal segment with about 6 secondary sensoria. Ventral abdominal
	setae longer than dorsal ones. Cornicles spiculose 8. stigmatus (Matsumura)
-	Stigma not marked as above. Eyes large. Frontal tubercles poorly developed. Frontal
	setae as long as 1st and 2nd antennal segments taken together. Third antennal segment with
	about 15 secondary sensoria. Ventral abdominal setae shorter than dorsal ones. Cornicles
	smooth
4.	Pronotum with a pair of spinal tubercles
-	Pronotum with 2 pairs of spinal tubercles
5.	Head with middle discal setae subequal to frontal setae in length and shape. Third antennal
	segment with setae as long as those of the 1st. Cornicles smooth
-	Head with middle discal setae shorter than frontal setae. Third antennal segment with
	setae shorter than those of the 1st. Cornicles spiculose on distal half
_	9. yokoyamai (Takahashi)
6.	Mesonotum without spinal tubercles. Sixth antennal segment with processus terminalis 1.7-
	1.9 times as long as base. Abdominal segments I-III with a pair of spinal tubercles
_	Mesonotum with spinal tubercles. Sixth antennal segment with processus terminalis 0.8-1.6
	times as long as base. All abdominal segments with a pair of spinal tubercles, of which
_	those of 1st-3rd segments much larger than the rest
7.	Frontal setae conspicuously or slightly capitate, as long as 1st antennal segment, shorter
_	than 2nd segment of hind tarsus. Hind femora with capitate setae 3. japonicus Higuchi
_	Frontal setae pointed, longer than 1st antennal segment, as long as 2nd segment of hind tarsus. Hind femora with pointed setae
o	•
8.	Metanotum with spinal tubercles. Head with 5 or 6 posterior discal setae on either side. Third antennal segment with 16-20 setae. Pronotum with 4-6 anterior pleural setae on either
	side. Cells of forewing with many pointed setae 6. quercicola (Matsumura)
_	Metanotum without spinal tubercles. Head with 2 posterior discal setae on either side.
	Third antennal segment with 7-10 setae. Pronotum with 2 anterior pleural setae on either
	side. Cells of forewing without setae 2. fulviabdominalis (Shinji)

1. Tuberculatus capitatus (Essig & Kuwana)

References. Essig & Kuwana 1918: 89 [Myzocallis]; Shinji 1941: 366 [Tuberculoides]; Tao 1963: 76 [Tuberculoides]; ibid. 1964a: 215 [Tuberculoides]; Paik 1965: 41 [Tuberculoides]; Moritsu 1953: 2; Richards 1968a: 566; Higuchi 1969: 112.

Host plants: Quercus acutissima Carruthers (after Essig & Kuwana, 1918), Quercus dentata Thunb. (after Shinji, 1941), Quercus mongolica var. grosseserrata Blume (after Shinji, 1941), Quercus serrata Thunb. (after Shinji, 1941), and Quercus variabilis Blume (after Moritsu, 1953).

Distribution: Japan (Honshû); Korea; Formosa; China.

2. Tuberculatus fulviabdominalis (Shinji)

References. Shinji 1941: 368 [Tuberculoides]; Paik 1965: 42 [Tuberculoides quercicola]; Higuchi 1969: 113.

Host plants: Quercus dentata Thunb., Quercus mongolica var. grosseserrata Blume, and Quercus serrata Thunb. (after Shinji, 1941).

Distribution: Japan (Honshû); Korea.

3. Tuberculatus japonicus Higuchi

References. Higuchi 1969: 114.

Host plants: Quercus dentata Thunb.

Distribution: Japan (Hokkaidô).

4. Tuberculatus kashiwae (Matsumura)

References. Matsumura 1917: 371 [Myzocallis]; ibid. 1919: 102 [Myzocallis naracola]; Higuchi 1969: 115.

Synonyms. Myzocallis naracola Matsumura, 1919. Syn. nov.

Host plants: Quercus dentata Thunb. (after Matsumura, 1917), Quercus mongolica var. grosseserrata Blume, and Quercus serrata Thunb.

Distribution: Japan (Hokkaidô; Honshû).

Having examined the slide (without date) identified by Dr. S. Matsumura as naracala Mats., I have come to the conclusion that naracola and kashiwae should be treated as one species. Judging from the literature the aphid stated by Shinji (1941) under the name Tuberculoides naracola seems to be another species.

5. Tuberculatus pilosus (Takahashi)

References. Takahashi 1929: 256 [Myzocallis]; Tao 1963: 78 [Tuberculoides]; ibid. 1964 a: 216 [Tuberculoides]; Higuchi 1969: 116.

Host plants: Quercus phillyraeoides A. Gray.

Distribution: Japan (Honshû); Formosa.

6. Tuberculatus quercicola (Matsumura)

References. Matsumura 1917: 368 [Acanthocallis]; Essig & Kuwana 1918: 90 [Myzocallis macrotuberculata]; Matsumura 1919: 101 [Ptychodes quercicola]; Shinji 1941: 378 [Tuberculoides macrotuberculata]; Paik 1965: 41 [Tuberculoides macrotuberculata]; Richards 1968a: 584; Higuchi 1969: 117.

Synonyms. Myzocallis macrotuberculata Essig & Kuwana, 1918; Ptychodes quercicola Matsumura, 1919. Syn. nov.

Host plants: Quercus acutissima Carruthers (after Shinji, 1941), Quercus dentata Thunb., Quercus mongolica var. grosseserrata Blume (after Matsumura, 1917), and Quercus serrata Thunb.

Distribution: Japan (Hokkaidô; Honshû); Korea.

Having examined syntypes of *Ptychodes quercicola* Matsumura, 1919, described from oviparous females and alate males taken at Sapporo, I have come to the conclusion that it should be suppressed as a synonym of *quercicola* Mats., 1917.

7. Tuberculatus querciformosanus (Takahashi)

References. Takahashi 1921 b: 72 [Myzocallis]; ibid. 1924: 713 [Myzocallis]; ibid. 1927: 19 [Myzocallis]; ibid. 1931: 82 [Tuberculoides]; Moritsu 1953: 8; Richards 1968a: 586; Higuchi 1969: 118.

Host plants: Quercus dentata Thunb.

Distribution: Japan (Hokkaidô; Honshû); Formosa.

8. Tuberculatus stigmatus (Matsumura)

References. Matsumura 1917: 375 [Arakawana]; Takahashi 1923: 64 [Myzocallis quercicola]; Okamoto & Takahashi 1926: 143 [Myzocallis nigra]; Shinji 1941: 386 [Tuberculoides]; Tao 1963: 80 [Tuberculoides]; ibid. 1964a: 216 [Tuberculoides]; Paik 1965: 39 [Tuberculoides]; Moritsu 1953: 4; Richards 1968a: 589; Higuchi 1969: 119.

Synonyms. Myzocallis nigra Okamoto & Takahashi, 1926.

Host plants: Quercus dentata Thunb. (after Moritsu, 1953), Quercus mongolica var. grosseserrata Blume, and Quercus serrata Thunb.

Distribution: Japan (Hokkaidô; Honshû); Korea; Formosa; China.

9. Tuberculatus yokoyamai (Takahashi)

References. Takahashi 1923: 63 [Myzocallis]; Moritsu 1953: 4 [kashiwae]; Richards 1968a: 593; Higuchi 1969: 120.

Host plants: Quercus mongolica var. grosseserrata Blume, and Quercus serrata Thunb.

Distribution: Japan (Hokkaidô; Honshû).

Species of Tuberculatus not included in the key

The following three oak aphids which were described as members of *Tuberculoides* v. d. Goot by Shinji might be referred to *Tuberculatus*. However, these species are excluded from the present key since I have seen no representatives.

10. Tuberculatus konaracola (Shinji)

References. Shinji 1941: 374 [Tuberculoides].

Host plants: Quercus serrata Thunb. (after Shinji, 1941).

Distribution: Japan (Honshû).

Judging from the original description, this species may be distinguished from other congeneric species by the following characters:—(1) Tubercles on 1st-2nd abdominal segments colourless, but those on 3rd black. (2) Cornicle black on distal half.

11. **Tuberculatus kunugi** (Shinji)

References. Shinji 1924: 346 [Myzocallis]; ibid. 1935 b: 7 [Tuberculoides].

Host plants: Quercus acutissima Carruthers (after Shinji, 1924).

Distribution: Japan (Honshû).

According to the original description, this speices is recognized by the following characters:—(1) Antenna longer than body; 3rd segment about as long as the 6th, with 4 setae and 2 small secondary sensoria; 4th segment about as long as the 5th, with 2 setae. (2) Each thoracic segment with a pair of finger-like tubercles. (3) Ab-

domen with 3 pairs of large finger-like tubercles. (4) Finger-like tubercles on abdomen, cornicles and cauda concolorous with body. (5) Cornicle about as long as tarsus in length.

12. Tuberculatus naganoe (Shinji)

References. Shinji 1941: 380 [Tuberculoides].

Host plants: Quercus dentata Thunb., Quercus mongolica var. grosseserrata Blume and Quercus serrata Thunb. (after Shinji, 1941).

Distribution: Japan (Honshû).

Judging from the original description, this species may be distinguished from any other species of *Tuberculatus* occurring in Japan by the following characters:—
(1) All tibiae black and all spinal tubercles concolorous with body. (2) Abdomen with each segment bearing a pair of tubercles, the tubercles on 1st-3rd segments being larger than the rest. (3) Cornicle faintly pigmented at apex.

Symydobius group

In most respects this group resembles the *Myzocallis* group, being distinguishable from the latter only by the presence of pleural abdominal setae in the embryonic stage. It may be distinct from the *Myzocallis* group and other groups by the combination of the following characters:—Apterae usually present. Head sometimes with a V-shaped suture. Processus terminalis 0.6-7.0 as long as base of 6th antennal segment. Ultimate rostral segment with 2-22 secondary setae. Apical tibial setae differing from other tibial setae. First tarsal segment usually without dorsal setae. Empodial setae flattended. Eighth abdominal segment with 6-28 setae. Rudimentary gonapophyses 1 or 2, rarely 3 in number. Wax plates sometimes present.

In the species of this group the embryo is characterized as follows:—Dorsal setae conspicuous except for *Betulaphis* and *Boernerina*; spinal and pleural setae arranged in parallel rows and capitate in shape except for *Callipterinella*, *Clethrobius*, *Euceraphis*, and *Symydobius*; marginal setae single in number except for *Clethrobius* and *Symydobius*. There is no remarkable difference between *Hannabura* and *Calaphis* in this stage.

13. Genus Betacallis Matsumura

References. Matsumura 1919: 110.

Type-species. Betacallis alnicolens Matsumura, 1919.

Betacallis is most easily recognized by the head with a broad dark band on the venter (fig. 14, A). This genus is probably Asiatic, being represented by two species.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 42, E, the setae being comparatively long, capitate; pleural setae present; marginal setae single. Cornicles visible.

Host plants: Betulaceae.

Distribution: Eastern Palaearctic region.

Key to the Japanese species of Betacallis

Alate viviparous female

1. Betacallis alnicolens Matsumura

References. Matsumura 1919: 110.

On the basis of the present specimens, a redescription of the alate viviparous female is given below:—

Alate viviparous female: Body pale green in life, about 3.5 mm. including cauda. Antennal tubercles well developed. Head (fig. 14, A) smooth, with 4 pairs of long, pointed setae on dorsum. Eyes not reaching antennae; median ocellus situated on a distinct triangular part. Antennae very slender, about 1.6 times as long as body; 3rd segment a little broadened on basal part, with about 23 transversely elongate secondary sensoria in a row on basal 4/7, these sensoria not surrounded by spinules; 4th faintly imbricated, with pale streaks; 5th more distinctly imbricated; 6th with processus terminalis about 1.8 times as long as base of the segment; primary sensorium of 6th much elongated longitudinally, large, about 2.5 times as long as middle breadth of 6th segment, surrounded by setae; accessory sensoria present near primary one. Clypeus with a pair of long anterior setae; mandibular lamina with 2 setae. Rostrum short, not reaching middle coxae; ultimate segment with 4 pairs of secondary setae. Prothoracic setae 10 in number, long, at least 3 times as long as middle breadth of 3rd antennal segment. Legs: femora long, narrowed towards base; tibiae with many spines on distal part, and with 4 large stout spine-like setae at tip; tarsi with 1st segment wanting dorsal setae, and with 5 ventral setae; 2nd segment of hind tarsus

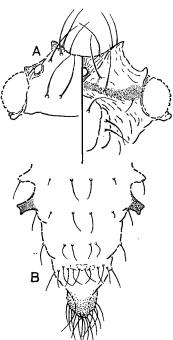

Fig. 14. Betacallis alnicolens Matsumura. Alate viviparous female:— A, head; B, abdomen.

slightly longer than ultimate segment of rostrum, much shorter than basal part of 6th antennal segment. Abdomen (fig. 14, B): 1st-7th segments with spinal setae about equal to those on 8th segment and longer than pleural setae; marginal tubercles well developed, the tubercles on 4th and 5th segments being especially large, but much smaller than cornicles. Cornicles pale at base, distinctly over twice as long as wide at middle, shorter than basal part of 6th antennal segment, tapered toward apex, corrugated, but not imbricated, and with flange moderately developed. Measurements of maximal setae in micra as follows:— head 151 (137-167), antenna (3rd seg.) 27 (23-30)

abdomen (6th seg.) 136 (128-151), leg (hind tibia) 189 (174-212).

Specimens examined: Many alate viviparous females taken at the following localities: Hokkaidô—Sapporo, 2-viii-1960, ex *Alnus* sp., R. Takahashi leg.; Mt. Daisetsu, 25-vii-1957, ex *Alnus* sp., S. Takagi leg. Honshû—Sukayu, Aomori-ken, 19-vi-1967, ex *Alnus* sp.; Sendai, Miyagi-ken, 27-vi-1967, ex *Alnus hirsuta* var. *sibirica*; Shirabutakayu, Yamagata-ken, 29-vi-1967, ex *Alnus hirsuta* var. *sibirica*; Oku-kinu, Tochigi-ken, 11-vii-1967, ex *Alnus hirsuta* var. *sibirica*; Nikkô, Tochigi-ken, 2-viii-1962, ex *Alnus hirsuta* var. *sibirica*, R. Takahashi leg.; Mt. Yatsugatake, Yamanashi-ken, 31-vii-1967, ex *Alnus* sp.; Karasawa, Nagano-ken, 25-vii-1967, ex *Alnus matsumurae*; Mt. Norikura, Nagano-ken, 11-viii-1961, ex *Alnus matsumurae*, R. Takahashi leg.; Mt. Daisen, Tottori-ken, 21-viii-1967, ex *Alnus* sp. Shikoku—Ichiûmura, Tokushima-ken, 20-viii- 1958, ex *Alnus hirsuta*, R. Takahashi leg.

Host plants: Alnus hirsuta Turcz., Alnus hirsuta var. sibirica Fischer, Alnus japonica Thunb. (after Matsumura, 1919), Alnus matsumurae Callier.

Distribution: Japan (Hokkaidô; Honshû; Shikoku).

2. Betacallis odaiensis Takahashi

References. Takahashi 1961 a: 6; Ghosh & Raychaudhuri 1968: 190; Ghosh, Basu & Raychaudhuri 1970: 67.

Alate viviparous female: Measurements of 10 specimens in mm. Body 2.81 (2.40–3.04); antennal segments (1st–6th): 0.12 (0.11–0.15), 0.07 (0.07–0.08), 1.30 (1.00–1.40), 0.95 (0.81–1.04), 0.80 (0.75–0.89), 0.31 (0.29–0.32)+0.67 (0.65–0.68); ultimate rostral segment 0.14 (0.12–0.16); hind femur 0.95 (0.77–1.09), hind tibia 1.99 (1.74–2.18); 2nd segment of hind tarsus 0.14 (0.12–0.16); longest seta on head 0.103 (0.090–0.129), that on 3rd antennal segment 0.020 (0.016–0.026), that on 6th abdominal segment 0.026 (0.023–0.032), that on hind tibia 0.145 (0.097–0.167).

Specimens examined: 1 alata (holotype) taken at Odaigahara, Nara-ken, 18-viii-1956, M. Sorin leg. Many alatae taken at the following localities: Shirabutakayu, Yamagata-ken, 29-vi-1967, ex *Betula ermanii*; Mikuni, Niigata-ken, 2-vii-1967, ex *Betula platyphylla* var. *japonica*; Oku-kinu, Tochigi-ken, 11-, 12-vii-1967, ex *Betula maximo-wicziana*.

Host plants: Betula platyphylla var. japonica (Miq.), Betula ermanii Cham., Betula maximowicziana Regel. In Sikkim Castanospermum sp. and a plant of Acanthaceae-have been recorded as hosts (after Ghosh & Raychaudhuri, 1968).

Distribution: Japan (Honshû); Sikkim.

14. Genus Betulaphis Glendinning

References. Glendinning 1926: 96; Cottier 1953: 105.

Type-species. (Betulaphis occidentalis Glend., 1926) = Betulaphis quadrituberculata (Kaltenbach, 1843).

This genus is probably Holarctic, being represented by the following five species: quadrituberculata (Kalt.) from Europe, North America, and New Zealand, arctosetis Richards from Baffin Island and Northern Alaska, viridis Richards and aureus Richards from Canada, pelei H. R. L. from Greenland and japonica Tak. from Japan. All the species live on Betula spp.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 42, J; spinal and pleural setae very short and inconspicuous; marginal setae capitate and single. Cornicle visible.

Host plants: Betulaceae.

Distribution: Holarctic and Australian regions.

1. Betulaphis japonica Takahashi

References. Takahashi 1961 a: 4.

Apterous viviparous female: Measurements of 10 specimens in mm. Body 1.36 (1.11-1.60); antennal segments (1st-6th); 0.06 (0.05-0.08), 0.04 (0.03-0.05), 0.27 (0.21-0.28), 0.16 (0.10-0.18), 0.13 (0.09-0.14), 0.10 (0.08-0.10)+0.10 (0.08-0.10); ultimate rostral segment 0.06 (0.05-0.06); hind femur 0.31 (0.23-0.36); hind tibia 0.50 (0.35-0.60); 2nd segment of hind tarsus 0.10 (0.08-0.12); longest seta on head 0.045 (0.032-0.065), that on 3rd antennal segment 0.010 (0.006-0.012), that on 6th abdominal segment 0.008 (0.003-0.012), that on hind tibia 0.036 (0.026-0.039).

Specimens examined: 3 apterous viviparous females and nymphs (syntypes) taken at Mt. Norikura, Nagano-ken, 11-viii-1959, ex Betula sp., R. Takahashi leg. Many apterous viviparous females taken at the following localities: Hokkaidô—Sapporo, 12-vi-1968, ex Betula platyphylla var. japonica; Ônuma, 16-vi-1967, ex Betula platyphylla var. japonica. Honshû—Nikkô, Tochigi-ken, 10 -vii-1967, ex Betula maximo-wicziana; Karasawa, Nagano-ken, 26-vii-1967, ex Betula sp.

Host plants: Betula maximowicziana Regel, Betula platyphylla var. japonica (Miq.), Betula sp.

Distribution: Japan (Hokkaidô; Honshû).

Judging from the description, *Betulaphis aureus* Richards described from Canada is closest to this species. Furthermore, the species is very similar to *Betulaphis quadrituberculata* (Kalt.), but it differs from the latter by the following characters:—
(1) Anterior abdominal segments with spinal setae short, at most 1/3 as long as marginal ones. (2) Hind tibia not more than 0.6 mm. in length.

15. Genus Boernerina Bramstedt

References. Bramstedt 1940: 11; Hille Ris Lambers 1962: 112.

Type-species. Boernerina depressa Bramstedt, 1940.

Boernerina Bramstedt is a small genus, of which the members are associated with Alnus spp. In Japan has been known to occur only a single species, which seems to be restricted to mountainous regions.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 42, I; spinal and pleural setae very short and inconspicuous; marginal setae single, capitate. Cornicle visible.

Host plants: Betulaceae.

Distribution: Holarctic region.

1. Boernerina alni Takahashi

References. Takahashi 1961 a: 3; Hille Ris Lambers 1962: 118; Sorin 1970: 254.

As far as I am aware, the alate viviparous female of the species has hitherto been undescribed. On the basis of the present specimens a description is given as follows:—

Alate viviparous female: Body about 2.4 mm. in length. Head (fig. 15, A) faintly corrugated, with a pair of prominent tubercles near anterior margin, the tubercles being at least 4/5 as long as their width in the middle. Antennae about 0.8 as long as body; 3rd segment (fig. 15, C) imbricated but not spinulose, with about 12 short, pointed setae, and with 4–8 secondary sensoria on basal 2/5; primary sensoria with hairy fringe; 6th with processus terminalis about 0.7 as long as base of the segment. Clypeus faintly corrugated, with a pair of anterior setae; mandibular lamina with a seta. Rostrum short, not reaching middle coxae; ultimate segment about 0.9 as long as 2nd segment of hind tarsus, with 6 secondary setae besides primary ones. Pronotum with 8 pointed setae about equal to cephalic setae in length. Legs: femora narrowed towards base, with spinules on distal part, and with some pointed setae as

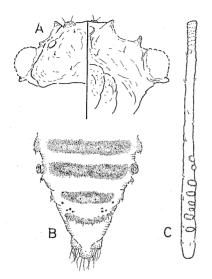

Fig. 15. Boernerina alni Takahashi. Alate viviparous female:—A, head; B, abdomen; C, 3rd antennal segment.

long as or a little shorter than tibial setae; tibiae with very stout, spine-like setae at apex; 1st segment of all tarsi with 6 or 7 setae ventrally and 2 setae dorsally; 2nd tarsal segment with conspicuous spinules on the imbrications. Abdomen (fig. 15, B) with a spino-pleural sclerotic bar on each segment, the bar being pigmented and broad. Dorsal abdominal setae arranged as in apterae, the spinal and pleural setae inconspicuous, and the marginal setae not capitate, about twice as long as spinal setae on abdomen; 8th segment with 8 setae. Cornicles short, with a weakly developed flange. Cauda knobbed, with about 12 pointed setae. Genital plate not defined distinctly. Waxglands on head, pronotum, and abdomen conspicuous in dark specimens, while invisible in pale ones. Measurements of maximal setae in micra as follows:—head 13.5 (7.5-15), antenna (3rd seg.) 10 (7.5-15), abdomen (6th seg.) 6 (4-10), leg (hind tibia) 35 (30–45).

Specimens examined: 1 aptera (holotype) taken at Mt. Norikura (altitude 3026 m), Gifu-ken, 12-viii-1959, ex *Alnus* sp., R. Takahashi leg.

Many apterous viviparous females taken at the following localities: Hokkaidô—Mt. Teine (altitude 1024 m), 5-ix-1963, M. Miyazaki leg.; Mt. Eniwa (altitude 1320 m), 1-vii-1966, ex *Alnus maximowiczii*, M. Miyazaki leg. Honshû—Oku-kinu (altitude about 1200 m), Tochigi-ken 11-vii-1967, ex *Alnus hirsuta*; Karasawa (altitude about 2000 m), Nagano-ken, 26-vii-, 27-viii-1967, ex *Alnus matsumurae*. Some alate viviparous females, Futamata (altitude about 1000 m), Hokkaidô, 24-vii-1968, ex *Alnus maximowiczii*; Karasawa, Nagano-ken, 26-vii-, 27-viii-1967, ex *Alnus matsumurae*.

Host plants: Alnus alnobetula var. fruticosa (after Sorin, 1970), Alnus hirsuta Turcz., Alnus matsumurae Callier, Alnus maximowiczii Callier.

Distribution: Japan (Hokkaidô; Honshû).

16. Genus Calaphis Walsh

References. Walsh 1862; 301; Baker 1920: 26; Palmer 1952; 63; Archibald 1958: 124.

Type-species. Calaphis betullela Walsh, 1862.

This is a well-known genus of the subfamily. So far as I am aware, however, no species of the genus has hitherto been known to occur in Japan. In the course of the present study is added to the fauna of Japan one species, *C. betulaecolens* (Fitch).

Embryo: Dorsal setae long, capitate; spinal setae single, arranged in parallel rows; pleural setae present; marginal setae single. Cornicle visible.

Host plants: Betulaceae.

Distribution: Holarctic region.

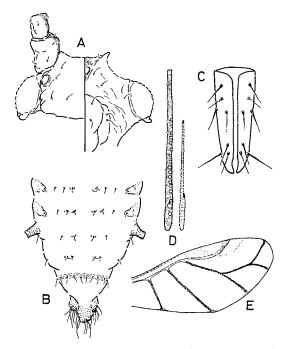

Fig. 16. Calaphis betulaecolens (Fitch). Alate viviparous female:— A, head; B, abdomen; C, ultimate rostral segment; D, 3rd and 6th antennal segments; E, fore wing.

1. Calaphis betulaecolens (Fitch)

References. Fitch 1851: 66 [Aphis]; Archibald 1958: 125.

Alate viviparous female: Head, thorax and abdomen yellowish green. Eyes red. Antennae: 1st and 2nd segments blackish brown at inner margin, 3rd and 4th segments on distal half blackish brown, 5th on distal 2/3 and 6th segment pale brown. Legs: femora at apex, tibiae and tarsi blackish brown. Fore wing (fig. 16, E) with veins bordered dusky. Body large, about 2.56 mm. in length. Antennal tubercles developed. Head (fig. 16, A) smooth; cephalic setae short, pointed, 0.5-0.7 as long as middle breadth of 3rd antennal segment; lateral ocellus as large as or a little larger

than secondary sensoria. Antennae long, 1.3-1.5 times as long as body; 3rd segment (fig. 16, D) with about 14-20 oval secondary sensoria on basal 7/10; 6th with primary sensorium surrounded by setae; one or 2 of accessory sensoria a little apart from primary one; processus terminalis 1.9-2.4 times as long as base of 6th antennal segment; length of 3rd-6th segments in proportion 77.5:52.5:42:18+36.5. Antennal setae blunt, short, 0.4-0.6 as long as middle breadth of 3rd antennal segment; 3rd segment with 21-38 setae, 4th with 10-15, and 5th with 6-9. Clypeus with a pair of anterior setae; mandibular lamina with 2 or 3 setae. Rostrum extending to midway between fore and middle coxae; ultimate segment 0.82-1.03 times as long as 2nd segment of hind tarsus, with 6-10 secondary setae. Legs: femora narrowed towards base, with spinules and setae sparsely; tibiae with spinules on distal 2/5, with many setae, of which the longest one is 1.3-1.6 times as long as middle breadth of 3rd antennal segment; 1st tarsal segment with 5 setae ventrally and 2 setae dorsally. Abdomen (fig. 16, B) smooth; 2nd-5th segments with 6-12 setae; 6th with 4 setae between cornicles, of which the longest one is 0.6-0.9 as long as middle breadth of 3rd antennal segment; 8th with 10 setae. Cornicles spiculosely imbricated, somewhat tapered, 0.6-0.8 as long as 2nd segment of hind tarsus. Cauda bearing 6 or 7 setae. Anal plate weakly divided.

Specimens examined: Some alate viviparous females, Sapporo, Hokkaidô, 4-vii-1970, ex *Betula platyphylla* var. *japonica*; Mt. Yatsugatake, Yamanashi-ken, 31-vii-1967, ex *Betula ermanii*.

Host plants: Betula ermanii Cham. and Betula platyphylla var. japonica (Miq.). Distribution: Japan (Hokkaidô; Honshû).

This species differs from *C. betullela* of North America, the type-species of *Calaphis*, by the following aspects:—(1) Abdomen without black transverse bands on dorsum.

- (2) Processus terminalis at most 2.4 times as long as base of 6th antennal segment.
- (3) Ultimate rostral segment with at least 6 secondary setae.

17. Genus **Callipterinella** van der Goot

References. van der Goot 1913: 118; ibid. 1915: 289.

Synonyms. *Procalaphis* Quednau, 1954 [type-species: *Aphis tuberculata* v. Heyden, 1837].

Type-species. (Aphis betularia Kalt., 1843) = Aphis tuberculata v. Heyden, 1837.

This genus is represented by two species: C. tuberculata (v. Heyden) from Europe and C. calliptera (Hartig) from Europe and North America. In this paper is given Japan as a locality of C. calliptera for the first time.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 42, C, the setae long, pointed; spinal setae a little longer than pleural ones, arranged in parallel rows; pleural setae present; marginal setae single. Cornicle visible.

Host plants: Betulaceae.

Distribution: Holarctic region.

1. Callipterinella calliptera (Hartig)

References. Hartig 1841: ? [Aphis]; Koch 1854: 7 [Chaitophorus annulatus]; van der Goot 1915: 290 [annulata]; Palmer 1952: 76 [Neosymydobius annulatus]; Börner 1952: 58 [Calaphis]; Szelegiewicz 1967: 55; ibid. 1968: 49.

Synonyms. Chaitophorus annulatus Koch, 1854.

This species is new to Japan. On the basis of the present material, a brief redescription is given below:—

Apterous viviparous female: Body about 1.7 mm. in length. Antennae 0.60-0.83 as long as body; 3rd segment with 2-7 (mostly 5) secondary sensoria; length of 3rd-6th segments in proportion 24:13:11:7+15.5. Ultimate rostral segment 0.9-1.1 times as long as 2nd segment of hind tarsus. Abdomen with black transverse band on each segment; marginal setae as long as or a little longer than spino-pleural setae. Measurements of maximal setae in micra as follows:—head 115 (86-144), antenna (3rd seg.) 18.3 (13.2-26.4), abdomen (6th seg.) 92.5 (76-167), leg (hind tibia) 88 (68-106).

Alate viviparous female: Body about 1.9 mm. in length. Antennae 0.68-0.84 as long as body; 3rd segment with 5-8 (mostly 7) secondary sensoria; length of 3rd-6th segments in proportion 31:19:14:7.5+16. Ultimate rostral segment 0.9-1.1 times as long as 2nd segment of hind tarsus. Abdomen with black bands as in apterae. Measurement of maximal setae in micra as follows:—head 98 (76-109), antenna (3rd seg.) 12 (7.6-15.2), abdomen (6th seg.) 65 (46-76), leg (hind tibia) 82 (76-90).

Specimen examined: Many apterous and alate viviparous females taken at the following localities: Hokkaidô—Sapporo, 29-vii-1969, ex *Betula platyphylla* var. *japonica*. Honshû—Morioka, Iwate-ken, 4-viii-1960, ex *Betula* sp., R. Takahashi leg.; Tsumagoi, Gumma-ken, 30-vii-1961, ex *Betula* sp., R. Takahashi leg.; Rokkô, Hyôgoken, 27-x-1956, ex *Betula* sp., R. Takahashi leg.

Host plants: Betula platyphylla var. japonica (Miq.), Betula sp. According to the literature the following plants are recorded as hosts:—Betula carpatica, B. pubescens, and B. verrucosa (in Poland, after Szelegiewicz, 1968), Betula alba and B. papyrifera (in U.S.A., after Palmer, 1952).

Distribution: Japan (Hokkaidô; Honshû); Europe; North America.

This species differs from *C. tuberculata* (v. Heyden) of Europe by the following aspects:—(1) Each abdominal segment with a black band. (2) Dorsal setae slender, not blunt in shape. (3) Antennal setae shorter, at most 4/5 as long as middle breadth of 3rd antennal segment.

18. Genus Clethrobius Mordwilko

References. Mordwilko 1928: 184.

Type-species. Callipterus giganteus Cholodkovsky, 1899.

This genus is represented by two species: C. comes (Walker, 1848) and C. giganteus (Chol., 1899), both of which occur in Europe. On this occasion I give Japan as a new locality of C. comes (Walker).

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 42, B, the setae being long, pointed; spinal setae double; pleural setae present; marginal setae triple; Cornicle visible.

Host plants: Betulaceae.

Distribution: Palaearctic region.

1. Clethrobius comes (Walker)

References. Walker 1848: 258 [Aphis]; Hille Ris Lambers 1947: 332; Börner 1952: 56 [Beta-

callis]; Szelegiewicz 1968: 48.

This species is new to Japan. On the basis of the specimens examined a redescription is given below:—

Alate viviparous female: Body dirty brown in life. Antennae black. Legs black; femora pale on basal half. Abdomen with black band on each segment. Cornicles and cauda black. Body large, about 4.4 mm. in length. Antennal tubercles developed. Head (fig. 17, A) with a V-shaped suture on ventrum; cephalic setae slender, hair-like, 1.6–2.9 (mostly 2.3) times as long as middle breadth of 3rd antennal segment; frontal setae 2, anterior setae 4, posterior setae 6–10 in number. Antennae strongly imbricated, about 0.74 as long as body; 3rd segment (fig. 17, C) with about 34–51 (mostly

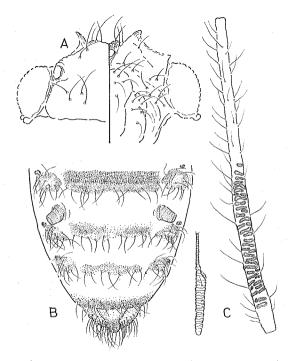

Fig. 17. Clethrobius comes (Walker). Alate viviparous female:—
A, head; B, abdomen; C, 3rd and 6th antennal segments.

44) transversely elongate secondary sensoria; 6th with primary sensorium surrounded by setae; one or 2 accessory sensoria a little apart from primary one; processus terminalis about 0.6 as long as base of 6th antennal segment; length of 3rd-6th segments in proportion 86:47:40:16+10. Antennal setae slender, hair-like, numerous in number; 3rd with about 40-65 setae, of which the longest one is about 1.5-2.5 times as long as middle breadth of 3rd antennal segment; 6th with 1 seta. Clypeus with 4-6 pairs of anterior setae; mandibular lamina with about 8 setae. Rostrum extending to midway between fore and middle coxae; ultimate segment 0.67-0.81 as long as 2nd segment of hind tarsus, with 18-24 setae including apical ones. Legs: femora narrowed towards base, tibiae narrowed on distal 1/4, with stout, spine-like

setae at apex; 1st segment of all tarsi with 7 setae ventrally and 2 setae dorsally. Abdomen (fig. 17, B): each segment with a spino-pleural sclerotic bar which includes wax plate; 2nd-5th segments with 14-20 setae excluding marginal ones; 6th with 10-16 setae between cornicles; 1st-7th segments with marginal sclerites bearing 12-18 (mostly 15) setae; marginal tubercles on 3rd-5th segments more developed, low conical or semiglobular, and with 1 or 2 setae. Cornicles corrugated, not attached to marginal sclerites, about 0.36-0.58 as long as 2nd segment of hind tarsus. Cauda knobbed and anal plate not bilobed, both bearing only elongate setae with pointed apices. Genital plate defined distinctly, spiculosely imbricated, with numerous setae in irregular rows.

Specimens examined: Many alate viviparous females taken at the following localities: Hokkaidô—Sapporo, 26-v-1967, ex Betula platyphylla var. japonica; Ônuma, 16-vi-1967, ex Betula platyphylla var. japonica. Honshû—Sukayu, Aomori-ken, 19-vi-1967, ex Betula maximowicziana; Suganuma, Gumma-ken, 22-vii-1967, ex Betula ermanii.

Host plants: Betula ermanii Cham., Betula maximowicziana Regel, and Betula platyphylla var. japonica (Miq.).

Distribution: Japan (Hokkaidô; Honshû); Europe.

This species may have been confused with *Symydobius kabae* (Matsumura) in Japan because of their similarity in pigmentation and because this species also feeds on *Betula* spp., but it differs from the latter by the number of setae on the 6th antennal segment and by the presence of wax-plates.

19. Genus Euceraphis Walker

References. Walker 1870: 2001; van der Goot 1915: 329; Baker 1920: 28; Theobald 1927: 372; Shinji 1941: 126; Börner 1952: 57; Palmer 1952: 68; Eastop 1966: 508.

Synonyms. Callipteroides Mordwilko, 1909 [type-species: (Aphis nigritarsis Heyden, 1837) = Euceraphis punctipennis (Zett.)]; Mimocallis Matsumura, 1919 [type-species: (Mimocallis betulijaponicae Matsumura, 1919) = Euceraphis punctipennis (Zett.)].

Type-species. (Aphis betulae: Walker, 1870, nec Linné, 1758) = Aphis punctipennis Zetterstedt, 1828.

This genus is composed of several species occurring on *Betula* spp. and *Alnus* spp. in the World, and is represented in Japan by two species.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 42, D, the setae long, pointed; spinal setae single; pleural setae present; marginal setae single. Cornicle visible.

Host plants: Betulaceae.

Distribution: Holarctic and Australian regions.

1. Euceraphis punctipennis (Zetterstedt)

References. Zetterstedt 1828: 559 [Aphis]; Heyden 1837: 299 [Aphis nigritarsis]; Koch 1855: 217 [Callipterus betulae]; Buckton 1881: 15 [Callipterus betulae]; Walker 1870: 2001 [betulae]; Mordwilko 1908: 377 [Callipteroides nigritarsis]; van der Goot 1915: 330 [betulae]; Matsumura 1919: 109 [Mimocallis betulijaponicae]; Theobald 1927: 373 [betulae]; Takahashi 1939: 126 [betulae]; Shinji 1941: 342 [betulae]; Palmer 1952: 68 [betulae]; Hille Ris Lambers 1952: 21; Börner 1952: 57; Archibald 1958: 128 [betulae]; Tao 1963: 75 [betulae]; Eastop 1966: 510; Szelegiewicz 1968: 48.

Synonyms. Aphis nigritarsis Heyden, 1837; Callipterus betulae Koch, 1881; Mimocallis betulijaponicae Matsumura, 1919.

Alate viviparous female: Measurement of 10 specimens in mm. Body 3.70 (3.48-4.12); antennal segments (1st-6th): 0.15 (0.15-0.18), 0.09 (0.08-0.09), 1.59 (1.44-1.73), 0.96 (0.89-1.26), 0.82 (0.74-1.00), 0.30 (0.27-0.33)+0.22 (0.19-0.26); ultimate rostral segment 0.15 (0.13-0.18); hind femur 1.51 (1.12-1.64); hind tibia 2.71 (1.82-3.14), 2nd segment of hind tarsus 0.19 (0.18-0.22); longest seta on head 0.038 (0.032-0.046), that on 3rd antennal segment 0.031 (0.025-0.039), that on 6th abdominal segment 0.053 (0.039-0.065), that on hind tibia 0.076 (0.065-0.083).

Specimens examined: Many alate viviparous females taken at the following localities: Hokkaidô—Sapporo, 8-vi-1967, 12-vi-1968, ex Betula platyphylla var. japonica; Obihiro, 17-vi-1965, ex Betula platyphylla var. japonica; Mt. Daisetsu, 25-vii-1957, ex Betula sp., S. Takagi leg.; Yukomanbetsu, 14-vii-1965, ex Betula sp. Honshû—Kaigake, Niigata-ken, 2-vii-1967, ex Betula platyphylla var. japonica; Oku-kinu, Tochigiken, 11-vii-1967, ex Betula maximowicziana; Karasawa, Nagano-ken, 26-vii-, 27-viii-1967, ex Betula ermanii; Mt. Ikoma, Ôsaka, 20-v-1956, ex Betula platyphylla var. japonica, M. Sorin leg.

Host plants: Betula ermanii Cham., Betula maximowicziana Regel, Betula platy-phylla var. japonica (Miq.), Betula sp. In Europe Betula albosinensis, B. alnoides, B. andrewsi, B. ermanii, B. fontinalis, B. glandulosa, B. grossa, B. obscura, B. oycoviensis, B. papyrifera, B. pendula, B. platyphylla, B. pubescens, B. sandbergii, B. tristis, B. turkenstanica, and B. viscosa have been recorded as hosts (after Eastop, 1966).

Distribution: Japan (Hokkaidô; Honshû); Formosa; Australia; Europe; North America; Greenland.

This is a well-known species in various parts of the World, feeding on *Betula* spp. Judging from the literature *Mimocallis betulijaponicae* Matsumura, 1919, is a synonym of this species as Tao (1963) already pointed out.

Species of Euceraphis not included in the key

2. Euceraphis ontakensis Sorin

References. Sorin 1970: 252.

Host plants. Alnus alnobetula var. fruticosa and Betula ermanii (after Sorin, 1970). Distribution. Japan (Honshû).

Judging from the literature this species resembles *E. punctipennis* (Zett.), but it differs from the latter by the distinct median longitudinal band on head.

20. Genus Hannabura Matsumura

References. Matsumura 1917: 377.

Type-species. Hannabura alnicola Matsumura, 1917.

This Asiatic genus is closely related to *Kallistaphis* Kirkaldy, from which it differs only by the 1st tarsal segment with 5 ventral setae and without dorsal setae.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 42, F, the setae being capitate; spinal setae single, arranged in parallel rows; pleural setae present, shorter than spinal ones; marginal setae single. Cornicle visible.

Host plants: Betulaceae. Distribution: Eastern Asia.

1. Hannabura alnicola Matsumura

References. Matsumura 1917: 377; ibid. 1919: 107.

As far as I am aware, the oviparous female of the species has hitherto been undescribed. On the basis of the present specimens a brief description of oviparae and, on this occasion, redescriptions of alatae and apterae are given as follows:—

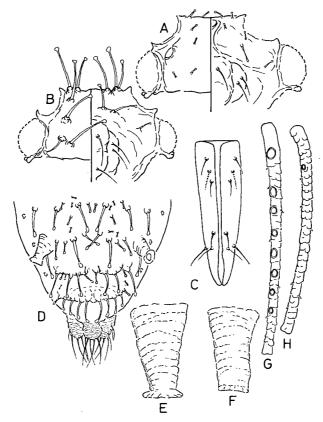

Fig. 18. Hannabura alnicola Matsumura. Alate viviparous female:—
A, head; F, cornicle; G, 3rd antennal segment. Apterous viviparous female:—B, head; C, ultimate rostral segment; D, abdomen; E, cornicle; H, 3rd antennal segment.

Apterous viviparous female: Body about 1.6 mm. in length. Antennal tubercles poorly developed. Head (fig. 18, B): cephalic setae long, capitate, bases of setae slightly tuberculate. Antennae slender, as long as or a little longer than body; 1st segment somewhat projected on inner side, 1.7–3.0 (mostly 2.3) times as long as 2nd segment; 3rd segment (fig. 18, H) with 0-2 secondary sensoria; accessory sensoria not apart from primary one; processus terminalis long, 1.3–2.8 (mostly 2.4) times as long

as base of 6th segment; length of 3rd-6th segments in proportion 24.5: 19:19:12+28. Antennal setae short, about 1/4 as long as middle breadth of 3rd antennal segment. Clypeus with a pair of anterior setae; mandibular lamina with 2 setae. Rostrum not surpassing middle coxae; ultimate segment (fig. 18, C) about 1.2 times as long as 2nd segment of hind tarsus, with 4-6 secondary setae besides primary ones. Pronotum with 1 anterior marginal seta, 1 posterior marginal seta, and 11-14 spinopleural setae on either side, all prothoracic setae capitate. Legs slender; fore coxae normal in shape; femora with short, capitate setae; tibiae with capitate or pointed setae, and without stout spine-like setae at apex; 1st tarsal segment with 5 ventral setae, no dorsal setae. Abdomen (fig. 18, D): dorsal setae variable in length; 6th with about 13 setae between cornicles; marginal abdominal setae single; marginal tubercles not developed. Wax plates absent. Cornicle 0.6-0.9 as long as 2nd segment of hind tarsus, tapered toward apex, corrugated, and with well developed flange. Cauda knobbed and bearing 8 setae. Anal plate bilobed but not deeply incised. Rudimentary gonapophyses usually represented by a single cluster.

Alate viviparous female: Differs from the apterous viviparous female as follows:—Body without small tubercles. Head, thorax and abdomen with dorsal setae shorter than in apterae. Third antennal segment (fig. 18, G) with 6-10 (mostly 8) round or oval secondary sensoria in a row along whole length; length of 3rd-6th antennal segments in proportion 23:19:18:11+31. Cornicle without well developed flange. Wing venation normal.

Oviparous female: Very much like apterous viviparous female. Body with numerous small tubercles and long, capitate setae as in apterae. Third antennal segment with 1 secondary sensorium. Ultimate rostral segment a little longer than in apterae. Hind tibiae with 21–34 pseudosensoria.

	apterous vivip. female	alate vivip. female	oviparous female
head	76- 95 av. 83	15-23 av. 20	91
antenna (3rd seg.)	8	4- 8 av. 6	8
abdomen (6th seg.)	83-114 av. 97	15–30 av. 20	99-106 av. 102
leg (hind tibia)	23– 38 av. 29	23–30 av. 25	23 27 av. 25

Table 3. Chaetotactic data for *Hannabura alnicola* Matsumura. Measurements of maximal setae in micra:

Specimens examined: Many apterous viviparous females, Sôunkyô, Hokkaidô, 9-vii-1965, 17-vii-1968, ex Alnus sp.; Oirase, Aomori-ken, 21-vi- 1967, ex Alnus hirsuta var. sibirica; Shirabutakayu, Yamagata-ken, 29-vi-1967, ex Alnus sp.; Tokusawa, Nagano-ken, 25-vii-1967, ex Alnus hirsuta var. sibirica. Some alate viviparous females, Oirase, Aomori-ken, 21-vi-1967, ex Alnus hirsuta var. sibirica; Tokusawa, Nagano-ken, 25-vii-1967, ex Alnus hirsuta var. sibirica. 2 oviparous females, Sapporo, Hokkaidô, 2-viii-1968, ex Alnus sp.; Sôunkyô, Hokkaidô, 17-vii-1968, ex Alnus sp.

Host plants: Alnus hirsuta var. sibirica (Fischer), Alnus japonica (Thunb.) (after

Matsumura, 1919), and Alnus matsumurae Callier (after Matsumura, 1917).

Distribution: Japan (Hokkaidô; Honshû).

Judging from the literature the aphid stated by Shinji (1941) under the name Calaphis alnicola seems to be another species.

21. Genus Monaphis Walker

References. Walker 1870: 2001; van der Goot 1915: 340; Baker 1920: 32; Theobald 1927: 395; Börner 1952: 59.

Synonyms. Bradyaphis Mordwilko, 1894 [type-species: Aphis antennata Kalt., 1843].

Type-species. Aphis antennata Kaltenbach, 1843.

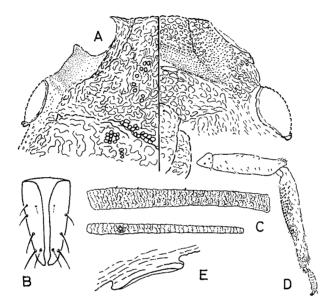

Fig. 19. Monaphis antennata (Kaltenbach). Oviparous female:—
A, head; B, ultimate rostral segment; C, 3rd and 6th antennal segment; D, hind leg; E, cornicle.

This genus is represented by only a single species, M. antennata (Kaltenbach). On this occasion I give Japan as a new locality of this species.

Embryo: Unknown.

Host plants: Betulaceae.

Distribution: Palaearctic region.

1. Monaphis antennata (Kaltenbach)

References. Kaltenbach 1843: 115 [Aphis]; Walker 1870: 2001; Mordwilko 1894: 59 [Bradyaphis]; van der Goot 1915: 340; Theobald 1927: 395; Börner 1952: 59; Szelegiewicz 1968: 51.

This species is new to Japan. On the basis of the present material, a brief redescription is given below:—

Oviparous female: Body dark green in life, corrugated, covered with very small warts, about 3.16 mm. in length. Head (fig. 19, A) fused with prothorax, with a median longitudinal suture. Antennae very stout and about 0.85 as long as body; processus terminalis (fig. 19, C) long, 5.0-7.5 times as long as base of 6th antennal segment; length of 3rd-6th segments in proportion 43:30:32:9+46. Ultimate rostral segment (fig. 19, B) about 0.88 as long as 2nd segment of hind tarsus. Legs (fig. 19, D) stout, short; hind tibiae bearing at least 80 pseudosensoria. Abdomen with broad, black bands on 6th-8th segments. Cornicles very short (fig. 19, E).

Specimens examined: Some oviparous females, Sapporo, Hokkaidô, 18-x-1967, ex Betula platyphylla var. japonica; Nikkô, Tochigi-ken, 7-x-1967, ex Betula maximo-wicziana.

Host plants: Betula maximowicziana Regel and Betula platyphylla var. japonica (Miq.).

Distribution: Japan (Hokkaidô; Honshû); Europe.

This species is characterized in having stout antennae.

22. Genus Neobetulaphis Basu

References. Basu 1964: 226.

Type-species. Neobetulaphis pusilla Basu, 1964.

This peculiar genus is represented by a single species, N. pusilla Basu, described from Assam. In the course of the present study a second species has been found from Japan.

Embryo: Unknown. Host plants: Betulaceae.

Distribution: Northern Oriental region.

1. Neobetulaphis alba, sp. nov.

Apterous viviparous female: Body pale yellow in life, corrugated on dorsum, about 1.48 mm. in length, each dorsal seta placed on a small tubercle. Head (fig. 20, A) covered with spinules on ventrum. Antennae (fig. 20, C) strongly imbricated, about 0.45 as long as body, without secondary sensoria; accessory sensoria fused with the margin of primary one; processus terminalis as long as base of 6th antennal segment; length of 3rd-6th segments in proportion 11:7:8:6+6. Antennal setae very short, inconspicuous, at most 3/10 as long as middle breadth of 3rd antennal segment; 3rd segment with 3 setae. Clypeus with a pair of anterior setae; mandibular lamina with a seta. Rostrum just reaching to middle coxae; ultimate segment (fig. 20, D) about 1.1 times as long as 2nd segment of hind tarsus, with 2-4 secondary setae besides primary ones. Pronotum with 10 setae, of which 4 are marginal, the prothoracic setae subequal to cephalic setae in length and shape. Legs: tibiae thickening on distal 1/6, with spine-like setae at apex; 1st segment of all tarsi with 5 setae. Abdomen (fig. 20, B): 1st-6th segments with 2 spinal, 2 pleural and 2 marginal setae, the spinal and marginal setae longer than pleural ones; 7th with 4 setae; 8th with 8 setae. Cornicles corrugated, 0.67-1.0 as long as their width at the base, at most 0.7 as long as 2nd segment of hind tarsus, with well developed flange. Cauda (fig. 20, E) elongate, constricted near basal 1/3, with about 20 setae. Anal plate deeply bilobate. Measurements of maximal setae in micra as follows:—head 72 (--), antenna (3rd seg.) 4.6 (3.8-6.1), abdomen (6th seg.) 62 (53-68), leg (hind tibia) 21 (19-23).

Specimens examined: Some apterous viviparous females (syntypes), Yumoto (Nikkô), Tochigi-ken, 10-viii-1967, ex Betula platyphylla var. japonica.

Host plants: Betula platyphylla var. japonica (Miq.).

Distribution: Japan (Honshû).

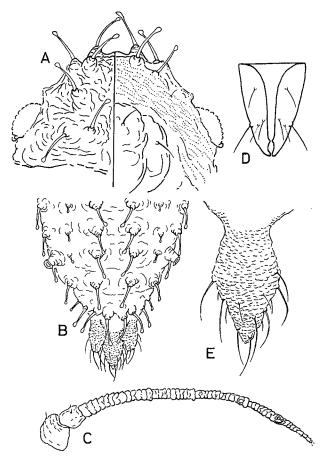

Fig. 20. Neobetulaphis alba, sp. nov. Apterous viviparous female:— A, head; B, abdomen; C, antenna; D, ultimate rostral segment; E, cauda.

This species is very closely related to *N. pusilla* Basu, but it differs from the latter by the following aspects:—(1) Third antennal segment at most twice as long as base of 6th antennal segment. (2) Processus terminalis at least 0.86 as long as base of 6th antennal segment. (3) Body at most 1.5 mm. in length. Judging from the literature the two species seem to differ only in the characters mentioned above. This may not be a fully reasonable basis for specific separation, but it seems better to regard them as distinct until the authentic material of *N. pusilla* from Assam is

available for further comparison.

23. Genus Neocalaphis Shinji

References. Shinji 1927: 28; Takahashi 1965: 54.

Type-species. Calaphis magnoliae Essig & Kuwana, 1918.

Neocalaphis Shinji differs from other related genera by the 6th antennal segment with very long processus terminalis. Its members associate with Magnolia, and are attended by ants. This genus is probably Asiatic, being represented by only two species from eastern Asia.

Embryo: Dorsal abdominal chaetotaxy as shown in Figs. 42, G & H, the setae being comparatively short, capitate; pleural

setae present; marginal setae single. Cornicle visible.

Host plants: Magnoliaceae. Distribution: Eastern Asia.

Key to the Japanese species of Neocalaphis

Alate viviparous female

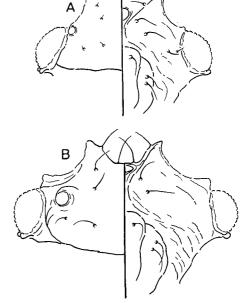

Fig. 21. Neocalaphis magnoliae (Essig & Kuwana) (A) and N. magnolicolens (Takahashi) (B). Alate viviparous female:—A & B, head.

1. Neocalaphis magnoliae (Essig & Kuwana)

References. Essig & Kuwana 1918: 85 [Calaphis]; Shinji 1923: 305 [Euceraphis magnolifoliae]; ibid. 1927: 28; ibid. 1941: 328 [Calaphis]; Paik 1965: 43 [Calaphis]; Takahashi 1965: 55.

Synonyms. Euceraphis magnolifoliae Shinji, 1923. Syn. nov.

Alate viviparous female: Measurements of 4 specimens in mm. Body 1.89 (1.76–1.97); antennal segments (1st–6th): 0.10 (0.09–0.11), 0.06 (0.05–0.06), 0.81 (0.77–0.88), 0.54 (0.49–0.64), 0.52 (0.49–0.59), 0.17 (0.17–0.18)+1.11 (--); ultimate rostral segment 0.08 (--); hind femur 0.55 (0.53–0.58); hind tibia 1.03 (0.95–1.07); 2nd segment of hind tarsus 0.09 (--); longest seta on head 0.016 (0.013–0.025), that on 3rd antennal segment 0.008

(--), that on 6th abdominal segment 0.019 (0.016-0.026), that on hind tibia 0.045 (0.039-0.049).

Specimens examined: 4 alate viviparous females, Tôkyô, 29-vii-1956, ex *Magnolia kobus*; Nara, Nara-ken, 23-viii-1957, ex *Magnolia* sp., R. Takahashi leg.

Host plants: Magnolia kobus Dc., Magnolia liliflora Desr. (after Shinji, 1923), and Magnolia sp.

Distribution: Japan (Honshû); Korea.

2. Neocalaphis magnolicolens (Takahashi)

References. Takahashi 1921 a: 27 [Calaphis]; ibid. 1923: 10 [Calaphis]; ibid. 1924: 109 [Calaphis]; Shinji 1941: 332 [Calaphis]; Takahashi 1965: 55.

Alate viviparous female: Measurements of 10 specimens in mm. Body 2.88 (2.36–3.30); antennal segments (1st-6th): 0.10 (0.08-0.12), 0.06 (0.05-0.08), 0.84 (0.58-0.98), 0.56 (0.41-0.68), 0.52 (0.38-0.59), 0.15 (0.12-0.18)+1.02 (0.83-1.27); ultimate rostral segment 0.16 (0.13-0.18); hind femur 0.75 (0.59-0.86); hind tibia 1.46 (1.23-1.65); 2nd segment of hind tarsus 0.13 (0.11-0.15); longest seta on head 0.063 (0.045-0.076), that on 3rd antennal segment 0.012 (0.008-0.016), that on 6th abdominal segment 0.039 (0.038-0.045), that on hind tibia 0.052 (0.038-0.064).

Specimens examined: Many alate viviparous females taken at the following localities: Hokkaidô—Sapporo, 28-ix-1967, ex *Magnolia obovata*; Ônuma, 16-, 17-vi-, 8-ix-1967, ex *Magnolia obovata*; Shikotsuko, 30-viii-1969, ex *Magnolia obovata*; Kitami, 25-vii-1968, ex *Magnolia obovata*; Yamabe, 13-ix-1969, ex *Magnolia* sp. Honshû—Sukayu, Aomori-ken, 19-vi-1967, ex *Magnolia obovata*; Towada, Aomori-ken, 22-vi-1967, ex *Magnolia obovata*; Kaigake, Niigata-ken, 2-vii-1967, ex *Magnolia* sp.; Oku-kinu, Tochigi-ken, 12-vii-1967, ex *Magnolia obovata*; Mt. Daisen, Tottori-ken, 21-viii-1967, ex *Magnolia* sp.

Host plants: Magnolia obovata Thunb. Distribution: Japan (Hokkaidô; Honshû).

24. Genus Symydobius Mordwilko

References. Mordwilko 1894: 58; Matsumura 1917: 369 [Yezocallis]; van der Goot 1919: 336; Baker 1920: 30; Theobald 1927: 376; Börner 1952: 56.

Synonyms. Yezocallis Matsumura, 1917 [type-species: Yezocallis kabae Matsumura, 1917].

Type-species. Aphis oblongus Heyden, 1837.

This genus is represented by three species: S. oblongus (Heyden, 1837) of Europe, S. alniaria (Matsumura, 1917) and S. kabae (Matsumura, 1917) of Asia. These species associate with Alnus and Betula, and are attended by ants.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 42, A, the setae being long, pointed; pleural setae present; marginal setae triple.

Host plants: Betulaceae.

Distribution: Palaearctic region.

Key to the Japanese species of Symydobius

Alate viviparous female

1. Body large, about 3.4 mm., without small tubercles on dorsum. Third antennal segment with

- about 60-70 secondary sensoria and about 70-90 setae. Processus terminalis about 0.8 as long as base of 6th antennal segment. On *Alnus* spp. 1. *alniaria* (Matsumura)
- Body smaller, about 3.0 mm., with small tubercles on dorsum. Third antennal segment with about 16-35 secondary sensoria and at most 50 setae. Processus terminalis about 0.6 as long as base of 6th antennal segment. On Betula spp. 2. kabae (Matsumura) Apterous viviparous female

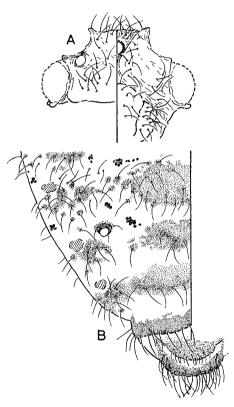

Fig. 22. Symydobius alniaria (Matsumura). Alate viviparous female:—A, head; B, abdomen.

1. *Symydobius alniaria* (Matsumura), comb. nov.

References. Matsumura 1917: 370 [Yezocallis]; Essig & Kuwana 1918: 87 [Euceraphis japonica].

Synonyms. *Euceraphis japonica* Essig & Kuwana, 1918. **Syn. nov.**

On the basis of the specimens examined a redescription is given below:—

Alate viviparous female: Blackish brown in life. Body about 3.4 mm. including cauda. Antennal tubercles developed. Head (fig. 22, A): cephalic setae delicate, hair-like, numerous in number. Antennae imbricated, about 0.8 as long as body; 3rd segment with about 60-70 transversely elongate secondary sensoria; 6th segment with primary sensorium surrounded by setae; accessory sensoria present near primary one; processus terminalis about 0.8 as long as base of 6th; length of 3rd-6th segments in proportion 77:39:32: 14+11. Antennal setae numerous in number; 3rd with about 70-90 setae; 6th with 11-13 setae. Clypeus faintly corrugated, with about 7 pairs of anterior setae; mandibular lamina with about 10 setae. Rostrum extending to midway between fore and middle coxae; ultimate segment about 0.8 as long as 2nd segment of hind tarsus, with about 8 pairs of secondary setae besides primary ones.

Prothoracic setae delicate, hair-like, very numerous in number. Legs: tibiae with numerous setae and with stout spine-like setae at apex; 1st segment of all tarsi with 7 setae ventrally and 2 setae dorsally. Abdomen: 2nd-5th segments with 40-60 setae excluding marginal ones; 6th with 10-20 setae between cornicles; 1st-7th segments with marginal sclerites bearing 7-16 (mostly 13) setae. Cornicle rather short, about 1/3 as long as 2nd segment of hind tarsus, corrugated, without flange. Cauda rounded. Anal plate not indented. Wing venation normal; stigma with about 10 setae along

posterior margin.

Apterous viviparous female: Differs from the alate viviparous female as follows:—Body smaller, about 3.1 mm. in length. Third antennal segment with about 25-50 secondary sensoria. Length of 3rd-6th antennal segments in proportion 73:34:29:14+11.

Specimens examined: An alate viviparous female (type of Euceraphis japonica Essig & Kuwana), Nikkô, Tochigi-ken, 11-vi-1913, ex Alnus indica glauca Ait., S. I. Kuwana leg. Many alate and apterous viviparous females, Kaigake, Niigata-ken, 2-vii-1967 ex Alnus hirsuta; Oku-kinu, Tochigi-ken, 12-vii-1967, ex Alnus hirsuta var. sibirica; Mt. Yatsugatake, Yamanashi-ken, 29-vii-1967, ex Alnus hirsuta.

Host plants: Alnus hirsuta Turcz., Alnus hirsuta var. sibirica (Fischer) (= A. indica glauca Ait.).

Distribution: Japan (Honshû).

Having examined the type of *Euceraphis japonica* E. & K., 1918, I have come to the conclusion that *E. japonica* should be suppressed as a synonym of *alniaria* (Mats., 1917).

This species is closely related to *Symydobius oblongus* (Heyden, 1837), from which it differs by the following aspects:—(1) Antennal setae long, about 1.0–2.5 times as long as middle breadth of 3rd antennal segment. (2) Third antennal segment with more numerous secondary sensoria, e. g. 60–70 in alatae, and 25–50 in apterae. (3) Fourth and 5th antennal segments not pale on the basal parts.

2. **Symydobius kabae** (Matsumura)

References. Matsumura 1917: 369 [Yezocallis]; Paik 1965: 45.

This species is closely related to the preceding one, from which it differs by the following aspects:—

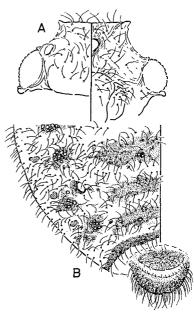

Fig. 23. Symydobius kabae (Matsumura). Alate viviparous female:—A, head. Apterous viviparous female:—B, abdomen.

Alate viviparous female: Body about 3.0 mm. in length. Antennae 0.9 as long as body; 3rd segment with 16-35 transversely elongate secondary sensoria and about 30-50 setae; processus terminalis about 0.6 as long as base of 6th antennal segment; length of 3rd-6th segments in proportion 65:34:30:14+8. Pronotum and abdomen with small tubercles. Marginal abdominal sclerites bearing about 15-20 setae.

Apterous viviparous female: Body smaller, about 2.5 mm. in length. Third antennal segment with about 16-30 secondary sensoria. Length of 3rd-6th antennal segments in proportion 68:33:29:14+9.

Specimens examined: Some alate viviparous females, Sapporo, Hokkaidô, 12-vi-1968, 10-vii-1970, ex *Betula platyphylla* var. *japonica*. 10 apterous viviparous females, Sapporo, Hokkaidô, 10-vii-1970; Mikuni, Niigata-ken, 2-vii-1967, ex *Betula platyphylla*

var. japonica.

Host plants: Betula maximowicziana Regel (after Matsumura, 1917), Betula platy-phylla var. japonica (Miq.).

Distribution: Japan (Hokkaidô; Honshû); Korea.

This species is easily distinguished from any other congeneric species in having small tubercles on the pronotum and abdomen. Judging from the literature the aphid stated by Shinji (1941) under the name *Symydobius kabae* seems to be another species.

Diphyllaphis group

This group may have been separated together with the Myzocallis and Symydobius groups from the ancestral stock, because they have particular apical tibial setae. The most important character of this group is that the 2nd antennal segment is longer than the 1st. This group is characterized by the following features:—Second antennal segment longer than the 1st. Processus terminalis 0.1-0.5 as long as base of 6th antennal segment. Ultimate rostral segment with 2-4 secondary setae. Apical tibial setae slightly differing from other tibial setae. First tarsal segment with 2-5 ventral setae, and without dorsal setae. Empodial setae hair-like except for Phyllaphis. Eighth abdominal segment with 4-6 setae. Rudimentary gonapophyses 2 in number. Wax plate present.

The embryo of this group is similar to that of the *Neophyllaphis* group in the arrangement, shape, and number of the dorsal setae. This suggest that this group is the most primitive stock among the *Myzocallis*, *Symydobius* and *Diphyllaphis* groups. *Machilaphis* and *Phyllaphis* are much alike in the embryonic stage.

25. Genus Diphyllaphis Takahashi

References. Takahashi 1960: 12.

Synonyms. Nymphaphis Takahashi, 1960 [type-species: Nymphaphis quercus Takahashi, 1960].

Type-species. Phloeomyzus konarae Shinji, 1924.

Diphyllaphis Takahashi is very closely related to Stegophylla Oestlund of North America, but it differs from the latter by the minute cornicle not surrounded by setae. This genus is represented by four species, of which the following three species occur in Japan.

Embryo: Dorsal abdominal setae very short, inconspicuous; pleural setae present; marginal setae single.

Host plants: Fagaceae.

Distribution: Palaearctic region.

Key to the Japanese species of Diphyllaphis

Apterous viviparous female

- Ultimate rostral segment (figs. 24, D & E) stiletto-like in shape. Antennae 0.26-0.36 as long as body. Cornicle (fig. 24, C) with pore about as wide as diameter of wax-pore. Second tarsal

1. Diphyllaphis alba Takahashi

References. Takahashi 1960: 13.

Apterous viviparous female: Measurements of 10 specimens in mm. Body 1.26 (1.09-1.40); antennal segments (1st-6th): 0.04 (0.03-0.04), 0.06 (0.06-0.07), 0.05 (0.05-0.06), 0.04 (0.04-0.05), 0.06 (0.05-0.06), 0.09 (0.08-0.10)+0.03 (0.02-0.03); ultimate rostral segment 0.09 (0.09-0.10); hind femur 0.20 (0.17-0.22); hind tibia 0.25 (0.20-0.27); 2nd segment 0.09 (0.09-0.10);

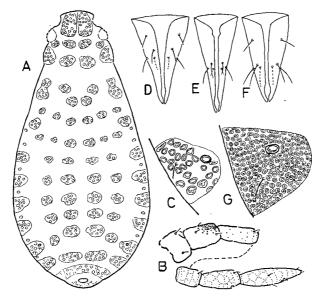

Fig. 24. Diphyllaphis konarae (Shinji) (A-D), D. alba Takahashi (E), and D. quercus (Takahashi) (F and G). Apterous viviparous female:—A, outline of the aphid; B, antenna; C & G, cornicle and wax-pores; D-F, ultimate rostral segment.

ment of hind tarsus 0.08 (--); longest seta on head 0.009 (0.008-0.011), that on 3rd antennal segment 0.004 (--), that on 6th abdominal segment 0.012 (0.010-0.013), that on hind tibia 0.012 (0.010-0.013).

Specimens examined: Some apterous females (syntypes), Ôsaka, ?-ix-1955, ex *Quercus phillyraeoides*, R. Takahashi leg. Many apterous viviparous females, Fukuoka, Fukuoka-ken, 22-x-1961, ex *Quercus phillyraeoides* var. *crispa*, R. Takahashi leg.

Host plants: Quercus phillyraeoides A. Gray, and Quercus phillyraeoides var. crispa Matsumura.

Distribution: Japan (Honshû; Kyûshû).

2. Diphyllaphis konarae (Shinji)

References. Shinji 1924: 369 [*Phloeomyzus*]; ibid. 1933a: 155 [*Phyllaphis*]; ibid. 1941: 295 [*Phyllaphis*]; ibid. 1944: 464 [*Phyllaphis*]; Takahashi 1960: 12.

Apterous viviparous female: Measurements of 10 specimens in mm. Body 1.37 (1.20-1.58); antennal segments (1st-6th): 0.04 (0.03-0.04), 0.07 (0.06-0.07), 0.08 (0.05-0.09), 0.05 (0.03-0.07), 0.07 (0.03-0.09), 0.10 (0.09-0.10)+0.03 (0.02-0.04); ultimate rostral segment 0.08 (0.07-0.09); hind femur 0.23 (0.20-0.26); hind tibia 0.29 (0.24-0.34); 2nd segment of hind tarsus 0.09 (0.08-0.10); longest seta on head 0.007 (0.005-0.011), that on 3rd antennal segment 0.008 (--), that on 6th abdominal segment 0.012 (0.010-0.013), that on hind tibia 0.022 (0.019-0.026).

Specimens examined: Many apterous females, Tôkyô, ?-x-1953, ex *Quercus serrata*, R. Takahashi leg.; Tondabayashi, Ôsaka, 30-x-1955, ex *Quercus serrata*, R. Takahashi leg.; Nagano, Ôsaka, 20-x-1957, ex *Quercus acutissima*, R. Takahashi leg.

Host plants: Quercus acutissima Carruthers, Quercus dentata Thunb. (after Shinji, 1944), Quercus mongolica var. grosseserrata (Blume) (after Shinji, 1935), and Quercus serrata Thunb.

Distribution: Japan (Honshû).

The aphid stated by Paik (1965) under the name *Phyllaphis konarae* is not the same as this species, differing by the area of wax-pores and by the shape of the ultimate rostral segment.

3. Diphyllaphis quercus (Takahashi)

References. Takahashi 1960: 14 [Nymphaphis]; Hille Ris Lambers 1966b: 616.

Apterous viviparous female: Measurements of 10 specimens in mm. Body 1.53 (1.49-1.75); antennal segments (1st-6th): 0.06 (0.05-0.07), 0.11 (0.09-0.11), 0.14 (0.11-0.15), 0.10 (0.08-0.11), 0.11 (0.09-0.14), 0.13 (0.11-0.14)+0.04 (0.04-0.05); ultimate rostral segment 0.09 (0.08-0.09); hind femur 0.30 (0.29-0.36); hind tibia 0.43 (0.38-0.47); 2nd segment of hind tarsus 0.12 (0.11-0.13); longest seta on head 0.015 (0.008-0.022), that on 3rd antennal segment 0.008 (0.006-0.011), that on 6th abdominal segment 0.032 (0.026-0.035), that on hind tibia 0.028 (0.020-0.029).

Specimens examined: Some apterous viviparous females (syntypes of *Nymphaphis quercus* Tak.), Tondabayashi, Ôsaka, 30-x-1955, ex *Quercus acutissima*, R. Takahashi leg. Many apterous viviparous females, Suibun, Ôsaka, 11-x-1959, ex *Quercus serrata*, R. Takahashi leg.

Host plants: Quercus acutissima Carruthers, Quercus serrata Thunb.

Distribution: Japan (Honshû).

26. Genus Machilaphis Takahashi

References. Takahashi 1960: 11.

Type-species. Phyllaphis machili Takahashi, 1928.

This genus is represented by only a single species.

Embryo: Dorsal abdominal setae very short, pointed; pleural setae present; marginal setae single.

Host plants: Lauraceae.

Distribution: Oriental region.

1. Machilaphis machili (Takahashi)

References. Takahashi 1928: 146 [*Phyllaphis*]; Shinji 1941: 296 [*Phyllaphis*]; Takahashi 1941: 14 [*Phyllaphis*]; ibid. 1960: 12.

Alate viviparous female: Measurements of 6 specimens in mm. Body 1.76 (1.56-1.97); antennal segments (1st-6th): 0.07 (0.07-0.08), 0.12 (0.11-0.13), 0.42 (0.36-0.45), 0.28 (0.24-0.32), 0.27 (0.27-0.29), 0.19 (0.18-0.20)+0.04 (0.03-0.05); ultimate rostral segment 0.10 (0.09-0.10); hind femur 0.53 (0.49-0.56); hind tibia 0.79 (0.73-0.86); 2nd segment of hind tarsus 0.15 (0.14-0.15); longest seta on head 0.019 (0.011-0.023), that on 3rd antennal segment 0.008 (0.005-0.010), that on 6th abdominal segment 0.022 (0.016-0.028), that on hind tibia 0.026 (0.023-0.032).

Apterous viviparous female: Measurements of 10 specimens in mm. Body 1.77 (1.64-1.92); antennal segments (1st-6th): 0.07 (0.06-0.07), 0.12 (0.11-0.12), 0.29 (0.25-0.35), 0.20 (0.18-0.22), 0.21 (0.19-0.24), 0.18 (0.16-0.18)+0.05 (0.04-0.05); ultimate rostral seg-

ment 0.10 (0.09-0.11); hind femur 0.44 (0.41-0.48); hind tibia 0.64 (0.58-0.71); 2nd segment of hind tarsus 0.14 (0.14-0.15); longest seta on head 0.015 (0.008-0.015), that on 3rd antennal segment 0.008 (0.005-0.010), that on 6th abdominal segment 0.026 (0.026-0.028), that on hind tibia 0.027 (0.023-0.032).

Specimens examined: Many apterous and alate viviparous females, Kasugayama, Nara-ken, 10-v-1959, ex *Machilus* sp., R. Takahashi leg

Host plants: Machilus thunbergii Sieb. & Zucc. (after Shinji, 1941), Machilus sp., Neolitsea sericea (Blume) (after Shinji, 1941). In Formosa Machilus bournee has been recorded as host (after Tao, 1963).

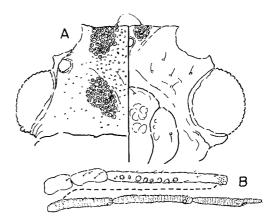

Fig. 25. Machilaphis machili (Takahashi).

Alate viviparous female:—

A, head; B, antenna.

Distribution: Japan (Honshû); Formosa; China; Tai.

27. Genus Phyllaphis Koch

References. Koch 1856: 248; van der Goot 1915: 342; Baker 1920: 24; Theobald 1927: 391; Shinji 1941: 119 (part); Börner 1952: 57; Cottier 1953: 90; Archibald 1958: 143; Eastop 1966: 517.

Type-species. Aphis fagi Linné, 1767.

This genus is represented by only a single species.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 42, K, the setae being very short, pointed; pleural setae present; marginal setae single.

Host plants: Fagaceae.

Distribution: Holarctic and Australian regions.

1. Phyllaphis fagi (Linné)

References. Linné 1767: 735 [Aphis]; van der Goot 1915: 343; Takahashi 1919b: 194 [fagi-

foliae]: Theobald 1927: 391; Monzen 1929: 44; Shinji 1933 a: 153; Takahashi 1937: 91 [fagifoliae]; Shinji 1941: 290; ibid. 1944: 463; Börner 1952: 57; Cottier 1953: 90; Archibald 1958: 144; Eastop 1966: 518; Szelegiewicz 1968: 49.

Synonyms. Phyllaphis fagifoliae Takahashi, 1919. Syn. nov.

Alate viviparous female: Measurements of 10 specimens in mm. Body 2.72 (2.58–2.94); antennal segments (1st-6th): 0.11 (0.10-0.13), 0.14 (0.13-0.14), 0.68 (0.66-0.77), 0.44 (0.42-0.45), 0.39 (0.37-0.40), 0.27 (0.26-0.29)+0.05 (0.04-0.05); ultimate rostral segment 0.11 (0.10-0.11); hind femur 0.87 (0.85-0.92); hind tibia 1.47 (1.41-1.62); 2nd segment of hind tarsus 0.20 (0.19-0.22); longest seta on head 0.028 (0.024-0.032), that on 3rd antennal segment 0.019 (0.012-0.024), that on 6th abdominal segment 0.022 (0.020-0.039), that on hind tibia 0.036 (0.026-0.045).

Alate male: Measurements of 3 specimens in mm. Body 2.29~(2.02-2.50); antennal segments (1st-6th): 0.08~(0.08-0.09), 0.11~(0.09-0.11), 0.52~(0.51-0.56), 0.34~(0.32-0.36), 0.34~(0.31-0.38), 0.26~(0.24-0.28)+0.05~(0.05-0.06); ultimate rostral segment 0.10~(0.10-0.11); hind femur 0.66~(0.64-0.68); hind tibia 1.03~(1.01-1.07); 2nd segment of hind tarsus 0.18~(--); longest seta on head 0.017~(0.015-0.019), that on 3rd antennal segment 0.010~(0.008-0.011), that on 6th abdominal segment 0.012~(--), that on hind tibia 0.033~(0.020-0.038).

Oviparous female: Measurements of one specimen in mm. Body 3.28; antennal segments (1st-6th): 0.12, 0.15, 0.48, 0.29, 0.27, 0.21+0.05; ultimate rostral segment 0.11; hind femur 0.70; hind tibia 1.09; 2nd segment of hind tarsus 0.18; longest seta on head 0.038, that on 3rd antennal segment 0.020, that on 6th abdominal segment 0.038, that on hind tibia 0.032.

Specimens examined: Many alate viviparous females taken at the following localities: Hokkaidô—Sapporo, 8-vi-1967, ex Fagus crenata, 4-vi-1970, ex Fagus crenata; Ônuma, 16-vi-1970, ex Fagus crenata. Honshû—Hirayu, Gifu-ken, 12-viii-1959, ex Fagus sp., R. Takahashi leg.; Mt. Kongô, Ôsaka, 17-v-1959, ex Fagus sp., M. Sorin leg. 3 males, Sapporo, 30-x-1966, 26-x-1967, ex Fagus crenata. Some oviparous females, Sapporo, Hokkaidô, 30-x-1966, 26-x-1967, ex Fagus crenata.

Host plants: Fagus crenata Blume, Fagus japonica Maxim. (after Monzen, 1929); Fagus sylvatica (in Europe after Theobald, 1927 & in Australia after Eastop, 1966).

Distribution: Japan (Hokkaidô; Honshû); Europe; North America; Australia; New Zealand.

Saltusaphis group

On account of the same number of rudimentary gonapophyses, the presence of wax plates and the cornicles not reticulated the Saltusaphis group is closely related to the Myzocallis and Symydobius groups rather than to the Chaitophorus group. This group is easily recognized from any other related groups by the absence of the triommatidion and by its association with Cyperaceae. It may be characterized by the combination of the following aspects:—Processus terminalis 0.5-0.9 as long as base of 6th antennal segment. Ultimate rostral segment with 2 secondary setae. Apical tibial setae not differing from other tibial setae. First tarsal segment with 4 or 5 ventral setae, and without dorsal setae. Empodial setae flattened or hair-like. Eighth abdominal segment with 8-18 setae. Cornicle ring-like, not reticulated. Rudimentary gonapophyses 2 in number. Wax plates present or absent.

In the species of this group the embryo is characterized as follows:—Dorsal setae very short, never capitate, those of *Subsaltusaphis* being often fan-like; marginal setae often double or more in number.

28. Genus Subsaltusaphis Quednau

References. Quednau 1953: 224.

Type-species. Saltusaphis intermedia Hille Ris Lambers, 1939.

Subsaltusaphis Quednau is easily distinguished from any other related genera by the presence of the fan-like dorsal setae. It is widely distributed in the Holarctic region, but no species of this genus has hitherto been known to occur in Japan. In this paper one species is added to the fauna of Japan.

Embryo: Dorsal setae mostly fan-like in shape; pleural setae present; marginal setae double or more in number.

Host plants: Cyperaceae.

Distribution: Holarctic region.

1. Subsaltusaphis saracola, sp. nov.

Apterous viviparous female: Body yellow in life, narrow and elongated, without two longitudinal strips, about 1.9 mm. in length. Head covered dorsally with spinules and many short, fan-like setae, the bases of the cephalic setae being pigmented; frontal setae long, not fan-shaped; vertex produced prominently at the middle. Antennae spiculosely imbricated, about 0.68 as long as body. Antennal setae short, at most 0.4 as long as middle breadth of 3rd antennal segment; 3rd segment with 7-11 pointed setae. Rostrum short, a little surpassing fore coxae; ultimate segment 0.38-0.50 as long as 2nd segment of hind tarsus, with 6-8 setae including apical ones. Legs covered with many spinules; tibiae without spine-like setae at apex; 1st segment of all tarsi with 5 setae. Head, thorax and abdominal segments clearly separated by pigmented intersegmental sclerites. Abdomen covered with spinules and fan-like setae as in head, the bases of the setae pigmented; 6th segment without elongate marginal setae; 8th segment roughly semicircular; all the setae on the hind margin of 8th segment and 2 marginal setae on 7th segment (fig. 26, G) elongate and blunt at apices. Cornicle short, 0.20-0.33 as long as its width of the base, spiculosely imbricated, without flange. Cauda knobbed, with about 13 setae. Anal plate bilobed, with 4-6 setae.

Alate viviparous female: Body yellow in life. Antennae: 3rd segment at apex and 4th segment on distal half, 5th and 6th segments brown. Legs pale brown; femora and tibiae at apex, and tarsi wholly brown. Head with a distinct median ocellus. Antennae about 0.5 as long as body; 3rd segment (fig. 26, F) with 8-11 circular secondary sensoria. Dorsal abdominal setae fewer than those of apterae in number. Abdomen (fig. 26, E) with a large median pigmented sclerite and some small ones. Marginal sclerites distinct. Other characters as in apterae viviparae.

Specimens examined: Some alate and apterous viviparous females (syntypes), Sapporo, Hokkaidô, 26-vii-1968, ex *Carex* sp.

Host plants: Carex sp.

Distribution: Japan (Hokkaidô).

In general appearance this species is very similar to picta (Hille Ris Lambers) of Europe, but it differs from the latter by the absence of distinctive median and submedian spots on the thorax and abdomen. Furthermore, the new species may be allied to Saltusaphis kienshuensis Shinji from Manchuria, China, but it differs from the latter as follows:—Thorax without a black patch; femora not enlarged.

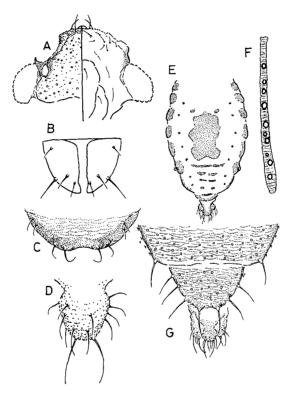

Fig. 26. Subsaltusaphis saracola, sp. nov. Alate viviparous female:—
A, head; B, ultimate rostral segment; C, dorsal setae of 8th abdominal segment; D, cauda; E, abdomen; F, 3rd antennal segment. Apterous viviparous female:—G, apical abdominal segments.

29. Genus **Thripsaphis** Gillette

References. Gillette 1917: 193; Baker 1920: 30; Theobald 1929: 67; Gillette & Palmer 1931: 909; Palmer 1952: 82; Cottier 1953: 81; Eastop 1966: 520.

Type-species. Brachycolus ballii Gillette, 1909.

This is a well-known genus including the following six subgenera: Allaphis Mordwilko, Synthripsaphis Quednau, Trichocallis Börner, Larvaphis Ossiannilsson, Peltaphis Frison & Ross, and Thripsaphis Gillette. So far as I am aware, however, no species of the genus has hitherto been known to occur in Japan. In the course of the present study is added to the fauna of Japan one species, which belongs to the subgenus Trichocallis.

Embryo: Dorsal setae very short, not fan-like; marginal setae single.

Host plants: Cyperaceae.

Distribution: Holarctic and Australian regions.

1. Thripsaphis (Trichocallis) ossiannilssoni Hille Ris Lambers

References. Hille Ris Lambers 1952a: 56; Quednau 1954: 39 [Trichocallis]; Szelegiewicz 1968: 60 [Trichocallis].

This species is new to Japan. On the basis of the specimens examined a redescription is given below:—

Apterous viviparous female: Body grayish brown in life. Antennae brown. Legs

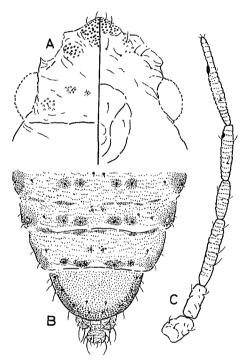

Fig. 27. Thripsaphis (Trichocallis) ossiannilssoni Hille Ris Lambers. Apterous viviparous female:—A, head; B, abdomen; C, antenna.

grayish brown. Abdomen: anterior segments on the middle part pale, 8th segment brown. Body covered with wax dust, very narrow and elongated, about 1.85 mm. in length. Head (fig. 27, A) narrower than body; vertex convex, being rather strongly produced at the middle. Antenna (fig. 27, C) very short, about 0.3 as long as body. Antennal setae short, at most 0.4 as long as middle breadth of 3rd antennal segment; 3rd segment with 5 or 6 setae. Rostrum very short, a little surpassing fore coxae, 0.3-0.5 as long as 2nd segment of hind tarsus, with 8 setae including apical ones. Legs: femora with spinules sparsely; tibiae without stout, spine-like setae at apex; 1st tarsal segment bearing 5 ventral setae. Abdomen (fig. 27, B) sclerotic, with 3rd to 6th segments solidly fused together; 6th segment with 7-9 setae between cornicles;

setae on the hind margin of 8th segment and some of the setae on the marginal sclerites of 7th segment longer than other dorsal setae; 8th segment semicircular, without any particular structure on the hind margin. Cornicle a mere ring, situated in the marginal sclerite of 6th abdominal segment. Cauda knobbed, with 8 setae. Anal plate bilobed, with 5 setae. Wax-glands present around the spinal and pleural setae.

Specimens examined: 12 apterous viviparous females, Mt. Muine, Hakkaidô, 25-viii-1969, ex *Carex* sp.; Nishi-koma, Nagano-ken, Honshû, 29-viii-1970, ex *Carex* sp., M. Miyazaki leg.

Host plants: Carex sp.; Carex fusca (in Europe after Szelegiewicz, 1968).

Distribution: Japan (Hokkaidô; Honshû); Europe (Sweden; Poland). This inconspicuous aphid was originally described from Sweden, but seems to be probably much more widely distributed than is indicated by the published records. In Japan this species seems to be restricted to mountainous regions.

This species is very easily distinguished from any other related ones by the very short antennae and the shape and pigmentation of the 8th abdominal segment as Hille Ris Lambers (1952) pointed out. The Japanese form taken at Muine, Hokkaidô, somewhat differs from the European one by the hind femora slenderer (10.5×3.3~11×3.4 in the European form; 13×3 in the Japanese form).

Yamatocallis group

This group has been placed in the *Myzocallis* or *Symydobius* group by previous authors. In the course of the present studies, however, I have been convinced that it should be placed near the *Chaitophorus* group on account of the reticulated cornicle and the host association. This group is characterized by the combination of the following characters:—Processus terminalis 1.5–2.8 times as long as base of 6th antennal segment. Secondary sensoria transversely elongated and with hairy fringe. Fore femora enlarged. Apical tibial setae not differing from other tibial setae. First tarsal segment with a pair of dorsal setae. Empodial setae flattened. Marginal sclerite with 1 long seta and some shorter setae. Eighth abdominal segment with 4 setae. Cauda elongated and cornicle long, reticulated at apex. Rudimentary gonapophyses 3 in number. Apterae not produced.

In this group the marginal setae of the embryo seem to be somewhat similar to those of *Periphyllus*, but they are not foliate.

30. Genus Yamatocallis Matsumura

References. Matsumura 1917: 366; Shinji 1923: 307 [Chaitophoraphis]; ibid. 1941: 133 [Drepanaphis]; Takahashi 1963: 160 [Megalocallis].

Synonyms. Chaitophoraphis Shinji, 1923 [type-species: (Chaitophoraphis acerifloris Shinji, 1923) = Yamatocallis hirayamae Matsumura]; Megalocallis Takahashi, 1963 [type-species: Megalocallis takagii Takahashi, 1963].

Type-species. Yamatocallis hirayamae Matsumura, 1917.

This Asiatic genus is very closely related to *Drepanaphis* del Guercio of North America, but it differs from the latter by the cornicle reticulated at apex. It appears to be an intermediate form between the *Myzocallis* and *Symydobius* groups and the

Chaitophorus group on account of the reticulated cornicle and the host association. In Japan three species of the genus have been known to occur.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 42, L, the spinal and pleural setae short, sometimes inconspicuous; marginal setae blunt, longer than spinal setae. Cornicle distinct.

Host plants: Aceraceae. Distribution: Eastern Asia.

Key to the Japanese species of Yamatocallis

Alate viviparous female

1. Cornicle (fig. 28, D) black, smooth, not swollen, rather cylindrical, 3.6-5.0 times as long as the base, 4.0-4.4 times as long as 2nd segment of hind tarsus. Fourth antennal segment 1.0-

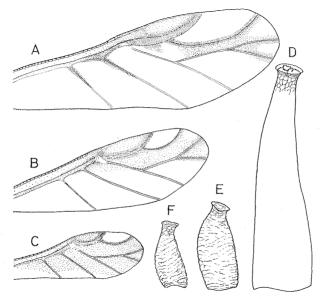

Fig. 28. Yamatocallis hirayamae Matsumura (B and E), Y. takagii (A and D), and Y. tokyoensis (Takahashi) (C and F). Alate viviparous female:—A-C, fore wing; D-F, cornicle.

1. Yamatocallis hirayamae Matsumura

References. Matsumura 1917: 367; Shinji 1923: 307 [Chaitophoraphis acerifloris]; ibid. 1933 b: 158; ibid. 1941: 389 [Drepanaphis].

Alate viviparous female. Measurements of 10 specimens in mm. Body 3.04 (2.64–3.50); antennal segment (1st–6th): 0.16 (0.15–0.18), 0.08 (--), 1.09 (0.95–1.18), 0.89 (0.80–0.98), 0.80 (0.71–0.94), 0.25 (0.21–0.32)+0.67 (0.58–0.80); ultimate rostral segment 0.12 (0.11–0.14); hind femur 0.80 (0.65–0.92); hind tibia 1.62 (1.40–1.87); 2nd segment of hind tarsus 0.18 (0.17–0.20); longest seta on head 0.055 (0.045–0.061), that on 3rd antennal segment 0.014 (0.008–0.016), that on 6th abdominal segment 0.068 (0.063–0.075), that on hind tibia 0.034 (0.031–0.038).

Specimens examined: Many alate viviparous females taken at the following localities: Hokkaidô—Sapporo, 8-, 13-vi-1967, ex *Acer* sp., 2-vi-1969, ex *Acer mono*. Honshû—Niigata-ken, 9-vi-1956, K. Shibata leg. Kyûshû—Mt. Hikosan, 3-v-1962, M. Shiga leg.

Host plants: Acer diabolicum Blume (after Shinji, 1923), Acer japonicum Thunb. (after Shinji, 1923), Acer mono Maxim.

Distribution: Japan (Hokkaidô; Honshû; Kyûshû).

Drepanaphis sauteri Takahashi from Formosa is a member of this genus, and is very close to this species, but differs by the number of secondary sensoria.

2. Yamatocallis takagii (Takahashi)

References. Takahashi 1963: 161 [Megalocallis].

Alate viviparous female: Measurements of 5 specimens in mm. Body 4.58 (4.48–4.66); antennal segments (1st–6th): 0.23 (0.23–0.24), 0.11 (--), 1.79 (1.62–2.08), 1.53 (1.29–1.79), 1.53 (1.49–1.59), 0.56 (0.50–0.62)+1.31 (1.21–1.41); ultimate rostral segment 0.18 (0.17–0.18); hind femur 1.38 (1.36–1.44); hind tibia 2.76 (2.71–2.91); 2nd segment of hind tarsus 0.21 (0.20–0.23); longest seta on head 0.098 (0.098–0.151), that on 3rd antennal segment 0.023 (--), that on 6th abdominal segment 0.129 (0.114–0.136), that on hind tibia 0.064 (0.061–0.068).

Specimens examined: 2 alate viviparous females (syntypes of *Megalocallis takagii* Tak.), Sapporo, Hokkaidô, 8-vi-1961, ex *Acer* sp., S. Takagi leg. Some alate viviparous females, Sapporo, Hokkaidô, 28-ix-1967, ex *Acer* sp.

Host plants: Acer sp.

Distribution: Japan (Hokkaidô).

3. Yamatocallis tokyoensis (Takahashi), comb. nov.

References. Takahashi 1923: 66 [Drepanphis (sic)]; Shinji 1933 b: 159 [moriokae]; ibid. 1941: 394 [Drepanphis moriokae].

Synonyms. Yamatocallis moriokae, 1933.

Alate viviparous female: Measurements of 10 specimens in mm. Body 2.42 (2.18–2.90); antennal segments (1st–6th): 0.14 (0.12–0.15), 0.07 (0.06–0.08), 0.81 (0.70–0.91), 0.75 (0.68–0.85), 0.76 (0.71–0.85), 0.31 (0.28–0.35)+0.57 (0.45–0.65); ultimate rostral segment 0.09 (0.09–0.10); hind femur 0.57 (0.48–0.61); hind tibia 1.18 (1.06–1.33); 2nd segment of hind tarsus 0.15 (0.14–0.17); longest seta on head 0.051 (0.038–0.064), that on 3rd antennal segment 0.008 (–), that on 6th abdominal segment 0.068 (0.053–0.076), that on hind tibia 0.027 (0.023–0.031).

Specimens examined: 15 alate viviparous females, Tôkyô, 19-v-1949, ex *Acer* sp., R. Takahashi leg.; Mt. Makiosan, Ôsaka, 16-vi-1957, ex *Acer* sp., M. Sorin leg.; Mt. Shigisan, Ôsaka, 21-v-1961, ex *Acer* sp., R. Takahashi leg.

Host plants: Acer sp.

Distribution: Japan (Honshû).

Yamatocallis moriokae Shinji, 1933 should be suppressed as a synonym of the present species.

Chaitophorus group

This group seems to be not so closely related to the Myzocallis and Symydobius groups which, are regarded as direct descendants of the primitive stock of this subfamily on account of the reticulated cornicle, four rudimentary gonapophyses, the host association, etc. This group is recognized by the following characters:—Body and antennae of both apterae and alatae bearing numerous long setae. Secondary sensoria round or oval in shape and not ciliated. Processus terminalis 1.0-4.0 times as long as base of 6th antennal segment. Ultimate rostral segment with 2-10 secondary setae. Apical tibial setae not differing from other tibial setae. First tarsal segment with 5-7 ventral setae, and without dorsal setae. Marginal abdominal sclerites with 5-11 setae. Cornicle truncate and reticulated. Cauda crescent-shaped or knobbed and with 6-14 setae. Wax plates absent.

The embryonic chaetotaxy of this group is characterized as follows:—Dorsal abdominal setae arranged in parallel rows, not capitate in shape; spinal setae single; pleural setae invisible (absent?) in *Periphyllus*; marginal setae single, often foliate in *Periphyllus*, while those of *Chaitophorus* long, pointed.

31. Genus Chaitophorus Koch

References. Koch 1854: 1; van der Goot 1915: 352; Baker 1920: 33; Theobald 1929: 8; Shinji 1941: 137; Palmer 1952: 90; Hille Ris Lambers 1960: 1.

Synonyms. Tranaphis Walker, 1870 [type-species: (Aphis salicivora Walker, 1848) = Aphis capreae Mosley, 1841]; Arctaphis Walker, 1870 [type-species: (Aphis populi: Walker, 1870) = Aphis populeti Panzer, 1805]; Eichochaitophorus Essig, 1912 [type-species: Eichochaitophorus populifolii Essig, 1912]; Pseudomicrella Börner, 1949 [type-species: Aphis vitellinae Schrk., 1801].

Type-species. (Chaitophorus populi Koch, 1854) = Chaitophorus populeti (Panzer, 1805).

This genus containing as many as thirty species is widely distributed in the world. Insofar as the present investigation goes, eight species have been known to occur in Japan, of which one is new to science and another new to Japan.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 42, N, the setae being long, pointed; spinal setae arranged in parallel rows; pleural setae present; marginal setae single, not foliate. Cornicle indistinct.

Host plants: Salicaceae.

Distribution: Holarctic, Oriental, and Ethiopian regions.

Key to the Japanese species of Chaitophorus

Apterous viviparous female

Hind tibiae with pseudosensoria.
 Hind tibiae without pseudosensoria.
 Rostrum reaching to middle coxae; ultimate segment with 2-4 secondary setae. Abdomen (fig. 29, G) granular; 6th segment with 16-24 setae. Third antennal segment with 1-3 setae. On Salix spp.
 Rostrum long, reaching to 1st abdominal segment; ultimate segment with 6-10 secondary setae. Abdomen (fig. 29, D) without granules and spinules; 6th segment with 8-12 setae. Third antennal segment with 12-18 setae. On Populus spp.
 Dorsal setae at least partially truncate or furcate at apex. Body pale.
 Dorsal setae pointed or blunt at apex. Body brown or pale.
 Body (fig. 29, H) scabrous on dorsum. Third antennal segment with 6-12 setae. Processus terminalis 2.0-2.7 (mostly 2.3) times as long as base of 6th antennal segment. First tarsal segment with 7 setae. Caudal setae 6 in number. On Populus spp.
 8 tremulae Koch

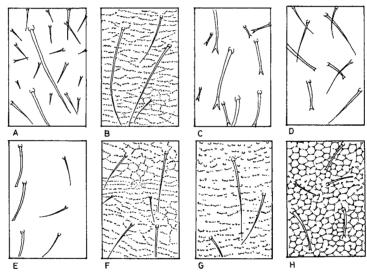

Fig. 29. Chaitophorus dorocola Matsumura (A), C. hokkaidensis, sp. nov. (B), C. horii Takahashi (C), C. populeti (Panzer) (D), C. saliapterus Shinji (E), C. salijaponicus Essig & Kuwana (F), C. saliniger Shinji (G), and C. tremulae Koch (H). Apterous viviparous female:—A-H, dorsal setae and sculpture of abdominal segment.

- Body (figs. 29, C & E) smooth or faintly roughened, but not scabrous. Third antennal segment with at most 5 setae. Processus terminalis 2.4-3.5 times as long as base of 6th antennal segment. First tarsal segment with 5 setae. Caudal setae 9-13 in number. 5
 Antennae shorter than 1/2 of body length. Cephalic and marginal setae not pointed at apex.
 Sixth abdominal segment with 16-21 settes between corridor, the language water being 7.3.88

- 6. Body (fig. 29, A) pale, not reticulated on dorsum. Sixth abdominal segment with 25-35 setae between cornicles. Processus terminalis 3.3-4.0 times as long as base of 6th antennal seg-

	ment. Ultimate rostral segment with 6-10 secondary setae. First tarsal segment with 7
	setae. Caudal setae 9 in number. On Populus spp 1. dorocola Matsumura
_	Body (figs. 29, B & F) brown, reticulated on dorsum. Sixth abdominal segment with at most
	15 setae between cornicles. Processus terminalis at most 2.8 times as long as base of 6th
	antennal segment. Ultimate rostral segment with 2-4 secondary setae. First tarsal segment
	with 5 setae. Caudal setae 6 or 7 in number
7.	Body with a pale median zone from metathorax to 3rd abdominal segment. Longest seta on
	6th abdominal segment 5.5-7.0 times as long as middle breadth of 3rd antennal segment.
	On Salix spp 6. salijaponicus Essig & Kuwana
_	Body without a pale median zone as above. Longest seta on 6th abdominal segment at least
	8.5 times as long as middle breadth of 3rd antennal segment. On Salix spp
	Alate viviparous female (except for salijaponicus)
1.	Hind tibiae with pseudosensoria
ı. 	Hind tibiae without pseudosensoria
2.	Pseudosensoria distributed on thickening part near basal part of hind tibiae. Chaetotaxy
۷.	of 3rd-6th antennal segments 3-5, 1-3, 1-2, 1-2. On Salix spp 7. saliniger Shinji
_	Pseudosensoria distributed along whole length of hind tibiae. Chaetotaxy of 3rd-6th an-
	tennal segments 13-15, 9-11, 6-7, 3. On <i>Populus</i> spp 4. <i>populeti</i> (Panzer)
3.	Antennae shorter than 1/2 of body length. Third antennal segment with 4 secondary sensoria.
0.	Chaetotaxy of 3rd-6th antennal segments 1-2, 1-2, 1, 1. On Salix spp
	Antennae longer than 1/2 of body length. Third antennal segment at least with 6 secondary
	sensoria and 5 setae
4.	Black sclerotic band on 4th abdominal segment bearing 26-28 setae. Third antennal segment
	with 16-18 secondary sensoria. On <i>Populus</i> spp 1. dorocola Matsumura
_	Black sclerotic band on 4th abdominal segment bearing at most 16 setae. Third antennal
	segment at most with 14 secondary sensoria
5.	Antennae at least 0.72 as long as body. Black sclerotic band on 4th abdominal segment
	bearing 6 or 7 setae. Secondary sensoria often present on 5th antennal segment. On Salix
	spp
-	Antennae at most 0.65 as long as body. Black sclerotic band on 4th abdominal segment

1. Chaitophorus dorocola Matsumura

References. Matsumura 1919: 113; Shinji 1941: 399.

On the basis of the present material, a redescription is given below:-

Apterous viviparous female: Body pale yellow in life. Antennae and legs pale. Cornicle and cauda pale. Body (fig. 29, A) rather smooth on dorsum, about 1.67 mm. in length; dorsal setae not furcate at apex. Head: cephalic setae variable in length, the longest seta is 5.6–8.4 times as long as middle breadth of 3rd antennal segment. Antennae (fig. 30, B) about 0.67 as long as body; 3rd segment 2.8–3.3 (mostly 3.0) times as long as base of 6th antennal segment; 6th with processus terminalis 3.3–4.0 (mostly 3.7) times as long as base of the segment; length of 3rd–6th segments in

proportion 18:9:9:6+22. Antennal setae: 3rd segment with 6-8 setae, of which the longest one is 2.4-4.7 times as long as middle breadth of the segment, 4th with 3-5, and 5th with 1-3. Rostrum surpassing middle coxae; ultimate segment 1.0-1.1 times as long as 2nd segment of hind tarsus, with 6-10 setae besides apical ones. Legs: tibial setae slender, variable in length, the longest one is 5.0-7.6 times as long as middle breadth of 3rd antennal segment; hind tibiae without pseudosensoria; 1st tarsal segment with 7 setae ventrally. Abdomen covered with many short, blunt setae and some long ones; 1st-7th segments fused, 8th segment well defined from 7th; 6th segment with 25-35 setae between cornicles, the longest seta being 7-10 times as long as middle breadth of 3rd antennal segment; 7th with 20-28 setae. Marginal sclerites invisible. Cornicle reticulated, 0.44-0.67 as long as 2nd segment of hind tarsus, at most 5/6 as long as base of 6th antennal segment. Cauda knobbed, with 9 setae.

Alate viviparous female: Body about 1.88 mm. in length. Head and thorax black sclerotic. Antennae (fig. 30, A) about 0.75 as long as body; 3rd segment with 16-18 secondary sensoria, 4th with 1-4; chaetotaxy of 3rd-6th segments 8-10, 4-6, 2-6, 2-3; length of 3rd-6th segments in proportion 27: 13: 12: 6.5+26. Abdomen with broad,

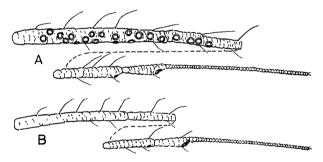

Fig. 30. Chaitophorus dorocola Matsumura. Alate viviparous female:—A, 3rd-6th antennal segments. Apterous viviparous female:—B, 3rd-6th antennal segments.

black bands on all segments, the band on 4th segment bearing 26-28 setae; intersegmental dots present and marginal sclerites distinct, rather large. Cornicle 1.0-1.1 times as long as 2nd segment of hind tarsus. Other characters as in apterae viviparae.

Specimens examined: Some apterous viviparous females, Dôya, Hokkaidô, 22-vi-1964, ex *Populus maximowiczii*, M. Miyazaki leg.; Futamata, Hokkaidô, 24-vii-1968, ex *Populus maximowiczii*. 4 alate viviparous females, Futamata, Hokkaidô, 24-vii-1968.

Host plants: Populus maximowiczii Henry, and Populus sieboldi Miq. (after Matsumura, 1919).

Distribution: Japan (Hokkaidô; Honshû).

This species is readily distinguished from any other related ones by the following characters:—(1) Dorsal setae numerous in number, 6th abdominal segment with 35-40 setae. (2) Processus terminalis long, about 3.7 times as long as base of 6th antennal segment. (3) Third antennal segment bearing at least 16 secondary sensoria.

2. Chaitophorus hokkaidensis, sp. nov.

Apterous viviparous female: Body colour in life unknown. In mounted speci-

mens head, thorax and abdomen brown. Antennae: 2nd segment on distal part, 3rd-4th segments, and 5th segment on basal part pale. Legs pale; hind femur, hind tibia on basal part, and tarsi brown. Body (fig. 29, B) distinctly reticulated, about 1.75 mm. in length; dorsal setae not furcate at apex. Head: cephalic setae variable in length, the longest seta is about 8.3 times as long as middle breadth of 3rd antennal segment. Antennae (fig. 31, B) about 0.56 as long as body; 3rd segment 1.9-2.1 (mostly 2.0) times as long as base of 6th antennal segment; 6th with processus terminalis 2.3-2.4 (mostly 2.4) times as long as base of the segment; length of 3rd-6th segments in proportion 14:10:10:7+16.5. Antennal setae slender; 3rd segment with 5-7 setae, of which the longest one is about 3.7 times as long as middle breadth of 3rd antennal segment, 4th with 3-5 setae, and 5th with 2-4 setae. Rostrum short, reaching just to middle coxae; ultimate segment 0.82-1.1 times as long as 2nd segment of hind tarsus, with 4 setae besides apical ones. Legs: tibial setae slender, variable in length, the longest seta is 6.3-6.7 times as long as middle breadth of 3rd antennal segment; hind tibiae without pseudosensoria; 1st tarsal segment with 5 setae ventrally. Abdomen: 2nd-6th segments fused, the other segments mutually free; 6th

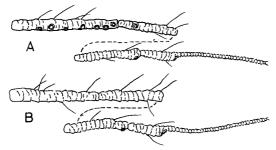

Fig. 31. Chaitophorus hokkaidensis, sp. nov. Alate viviparous female:—A, 3rd-6th antennal segments. Apterous viviparous female:—B, 3rd-6th antennal segments.

segment with 12-15 setae between cornicles, the longest seta being about 9.3 times as long as middle breadth of 3rd antennal segment; 7th with 12-14 setae. Marginal sclerites indistinct. Cornicle reticulated, 0.35-0.40 as long as 2nd segment of hind tarsus, at most 3/7 as long as base of 6th antennal segment. Cauda knobbed, with 6 or 7 setae.

Alate viviparous female: Body about 1.70 mm. in length. Head and thorax black sclerotic. Antennae (fig. 31, A) about 0.62 as long as body; 3rd segment with 9 or 10 secondary sensoria, 4th with 0-2; chaetotaxy of 3rd-6th segments 4-7, 3-5, 2-4, 2; length of 3rd-6th segments in proportion 18.5: 10:11:6.5+15.5. Abdomen with broad, black bands on all segments, the band on 4th segment bearing 10-13 setae; marginal sclerites rather large. Cornicle 0.56-0.65 as long as 2nd segment of hind tarsus. Other characters as in apterae viviparae.

Specimens examined: 2 apterae and 2 alatae (syntypes) taken at Shôwa-shinzan, Hokkaidô, 23-vi-1964, ex *Salix* sp., M. Miyazaki leg.

Host plants: Salix sp.

Distribution: Japan (Hokkaidô).

In general appearance this species is very similar to *C. salijaponicus* Essig & Kuwana, 1918, but it differs from the latter by the following aspects:—(1) Body without a pale median zone from metathorax to 3rd abdominal segment. (2) Longest seta on 6th abdominal segment about 9.3 times as long as middle breadth of 3rd antennal segment. (3) Third antennal segment 1.9–2.1 times as long as base of 6th antennal segment.

3. Chaitophorus horii Takahashi

References. Takahashi 1939: 122; Börner 1950: 3 [Tranaphis beuthani]; ibid. 1952: 53 [Tranaphis beuthani]; Szelegiewicz 1961: 245 [beuthani]; ibid. 1968: 66 [beuthani].

Synonyms. Tranaphis beuthani Börner, 1950. Syn. nov.

On the basis of the present material, a redescription is given below:-

Apterous viviparous female: Body pale green in life. Antennae pale; 3rd-5th segments at apex pale or pale brown. Legs pale; femora and tibiae at base pale brown. Cornicle pale brown. Cauda pale. Body (fig. 29, C) smooth on dorsum, about 1.46 mm. in length; dorsal setae very stout, furcate at apex. Head: cephalic setae variable in length, the longest seta is 5.2-8.9 times as long as middle breadth of 3rd antennal segment. Antennae about 0.37 as long as body, often 3rd and 4th segments connected; 3rd segment 1.5-2.6 (mostly 1.9) times as long as base of 6th antennal segment; 6th with processus terminalis 2.5-3.5 (mostly 2.7) times as long as base of the segment; length of 3rd-6th segments in proportion 8.5:4:9:4+11. setae short; 3rd segment with 1 or 2 setae, of which the longer one is 0.88-1.5 times as long as middle breadth of the segment, 4th with 1, and 5th with 1. Rostrum short, not reaching to middle coxae; ultimate segment 1.0-1.8 times as long as 2nd segment of hind tarsus, with 2 setae besides apical ones. Legs: tibial setae slender, variable in length, the longest seta is 3.0-5.0 times as long as middle breadth of 3rd antennal segment; hind tibiae without pseudosensoria; 1st tarsal segment with 5 setae ventrally. Abdomen: 1st-7th segments fused; 6th with 16-21 setae between cornicles, the longest seta being 7.3-8.8 times as long as middle breadth of 3rd antennal segment; 7th with 14-17 setae. Marginal sclerites invisible. Cornicle reticulated, 0.33-0.58 as long as 2nd segment of hind tarsus, at most 7/8 as long as base of 6th antennal segment. Cauda knobbed, with 9-13 setae.

Alate viviparous female: Body about 1.48 mm. in length. Head and thorax black sclerotic. Antennae about 0.44 as long as body; 3rd segment with 4 secondary sensoria, 4th without secondary sensoria; chaetotaxy of 3rd-6th segments 1-2, 1-2, 1, 1; length of 3rd-6th segments in proportion 11.5:5:5:5+10. Abdomen with black bands on dorsum, the band on 4th segment bearing 20-22 setae; intersegmental dots present and marginal sclerites distinct, with 5-9 setae. Cornicle about 0.55 as long as 2nd segment of hind tarsus. Other characters as in apterae viviparae.

Specimens examined: Many apterous viviparous females taken at the following localities: Hokkaidô—Shikotsuko, 30-viii-1969, ex Salix sp. Honshû—Tôkyô, 27-ix-1953, ex Salix sp., R. Takahashi leg.; Oku-kinu, Tochigi-ken, 11-vii-1967, ex Salix gilgiana; Nikkô, Tochigi-ken, 10-viii-1967, ex Salix sp.; Shirahone, Nagano-ken, 26-vii-1961, ex Salix sp., R. Takahashi leg. Kyûshû—Kagoshima-ken, 28-iv-1965, ex Salix koriyanagi, M. Miyazaki leg. 2 alate viviparous females, Tôkyô, 27-ix-1953, R. Takahashi leg.

Host plants: Salix gilgiana Seemen, Salix koriyanagi Kimura, and Salix sachalinensis Fr. Schm. (after Takahashi, 1939).

Distribution: Japan (Hokkaidô; Honshû; Kyûshû); Europe.

This species is characterized by the following characters:—(1) Dorsal setae furcate at apex. (2) Caudal setae 9-13 in number. (3) Antennal setae few in number, 3rd segment with 1 or 2, 4th with 1 or 2, and 5th with 1. On account of the characters mentioned above, *C. beuthani* (Börner, 1950) may be rightly identified with *C. horii* Tak., 1939.

4. Chaitophorus populeti (Panzer)

References. Panzer 1805: 6 [Aphis]; Koch 1854: 12 [populi]; van der Goot 1915: 354 [betulinus]; Matsumura 1917: 354 [populi]; ibid. 1919: 112 [populisieboldi]; Okamoto & Takahashi 1926: 142 [coreanus]; Shinji 1941: 418 [yamanarashi]; Börner 1952: 53; Stroyan 1957: 338; Szelegiewicz 1961: 278; Tao 1963: 46 [coreanus]; Paik 1965: 35 [coreanus]; Szelegiewicz 1968: 68.

Synonyms. Chaitophorus populi Koch, 1854, nec Linné, 1758; Chaitophorus betulinus van der Goot, 1915; Chaitophorus populisieboldi Matsumura, 1919; Chaitophorus coreanus Okamoto & Takahashi, 1926. **Syn. nov.** Chaitophorus yamanarashi Shinji, 1941. **Syn. nov.**

On the basis of the present material, a redescription is given below:-

Apterous viviparous female: Body blackish brown or brown except on a middle part in life. Antennae brown; 3rd segment on basal 4/5 pale and 4th segment on basal part often pale. Legs brown; fore femur on distal part and tibiae on middle part pale. Cornicle brown. Cauda pale or pale brown. Body (fig. 29, D) not smooth, but without spinules and granules on dorsum, about 1.75 mm. in length; dorsal setae at least partially truncate at apex. Head a little imbricated on marginal parts; cephalic setae variable in length, the longest seta is 3.5-5.3 times as long as middle breadth of 3rd antennal segment. Antennae about 0.68 as long as body; 3rd segment 2.9-4.5 (mostly 3.5) times as long as base of 6th antennal segment; 6th with processus terminalis 1.8-2.8 (mostly 2.4) times as long as base of the segment; length of 3rd-6th segments in proportion 23.5:13.5:11:7+16. Antennal setae slender; 3rd segment with 12-18 setae, of which the longest one is 1.8-3.5 times as long as middle breadth of the segment, 4th with 6-10 setae, and 5th with 4-6 setae. Rostrum long, reaching to 1st abdominal segment; ultimate segment 1.0-1.2 times as long as 2nd segment of hind tarsus, with 6-10 setae besides apical ones. Legs: tibial setae slender, variable in length, the longest seta is 2.7-4.3 times as long as middle breadth of 3rd antennal segment; hind tibiae with 7-13 pseudosensoria widely scattered; 1st tarsal segment with 6 setae ventrally. Abdomen not reticulated; 1st-7th segments fused; 6th with 8-12 setae between cornicles, the longest seta being 3.5-7.0 times as long as middle breadth of 3rd antennal segment; 7th with 8-11 setae. Marginal sclerites distinct, but the anterior marginal sclerites are smaller than the posterior ones. Cornicle reticulated, 0.33-0.50 as long as 2nd segment of hind tarsus, at most 11/13 as long as base of 6th antennal segment. Cauda knobbed, with 6-8 setae.

Alate viviparous female: Body about 1.77 mm. in length. Head and thorax black sclerotic. Antennae about 0.72 as long as body; 3rd segment with 13-15 secondary sensoria, 4th with 2; chaetotaxy of 3rd-6th segments 13-15, 9-11, 6-7, 3; length of 3rd-6th segments in proportion 25:14.5:12:7+17. Abdomen with equally thick,

black bands on all segments, the band on 4th segment bearing 9-12 setae; marginal sclerites rather large and intersegmental dots present. Cornicle 0.33-0.65 as long as 2nd segment of hind tarsus. Other characters as in apterae viviparae.

Specimens examined: Many apterous viviparous females taken at the following localities: Honshû—Morioka, Iwate-ken, 3-ix-1964, ex *Populus nigra* var. *italica*, M. Miyazaki leg.; Mt. Rokkô, Hyôgo-ken, 2-vi-1956, ex *Populus* sp., R. Takahashi leg.; Ôsaka, 2-x-1955, ex *Populus* sp., R. Takahashi leg. Some alate viviparous females, Morioka, Iwate-ken, 3-ix-1964, M. Miyazaki leg.

Host plants: Populus balsamifera (after Matsumura, 1917), Populus nigra var. italica Muenchh., Populus sieboldii Miq. (after Shinji, 1941). Furthermore, according to the literature the following plants are recorded as hosts:—Populus adenopoda (in China, after Tao, 1963), P. alba (in England, after Stroyan, 1957; in Poland, after Szelegiewicz, 1961), P. tomentosa (in China, after Tao, 1963), P. tremula (in England, after Stroyan, 1957; in Poland, after Szelegiewicz, 1961; in China, after Tao, 1963), P. tremula var. davidiana (in Korea, after Okamoto & Takahashi, 1926).

Distribution: Japan (Honshû; Kyûshû); Korea; China; Europe.

In the course of the present study I have come to the conclusion that *coreanus* Okamoto & Takahashi and *yamanarashi* Shinji should be suppressed as synonyms of this species.

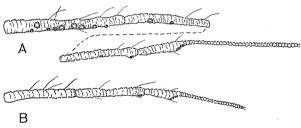

Fig. 32. Chaitophorus saliapterus Shinji. Alate viviparous female:—A, 3rd-6th antennal segments. Apterous viviparous female:—B, 3rd-6th antennal segments.

5. Chaitophorus saliapterus Shinji

References. Shinji 1924: 349; ibid. 1927: 39; ibid. 1941: 410.

On the basis of the present material, a redescription is given below:-

Apterous viviparous female: Body pale green in life. Antennae pale; 5th segment on distal half and 6th segment brown. Legs pale; tarsi brown. Cornicle pale or pale brown. Cauda pale. Body (fig. 29, E) not sclerotized, small, about 1.23 mm. in length; dorsal setae at least partially truncate or furcate at apex. Head: cephalic setae variable in length, the longest seta is 4.4-5.6 times as long as middle breadth of 3rd antennal segment. Antennae (fig. 32, B) about 0.61 as long as body; 3rd segment 1.7-2.6 (mostly 2.2) times as long as base of 6th antennal segment; 6th with processus terminalis 2.4-3.0 (mostly 2.6) times as long as base of the segment; length of 3rd-6th segments in proportion 11:6.5:7:5+13.5. Antennal setae: 3rd segment with 3-5 setae, of which the longest one is 2.2-4.0 times as long as middle breadth of the segment, 4th with 2 or 3, 5th with 2 or 3. Rostrum extending almost to middle

coxae; ultimate segment 0.53-0.72 as long as 2nd segment of hind tarsus, with 2 setae besides apical ones. Legs: tibial setae variable in length, the longest seta is 4.3-6.0 times as long as middle breadth of 3rd antennal segment; hind tibiae without pseudosensoria; 1st tarsal segment with 5 setae ventrally. Abdomen: 2nd-6th segments solidly fused, the other segments mutually free; 6th with 5-7 setae between cornicles, the longest seta being 2.8-5.2 times as long as middle breadth of 3rd antennal segment; 7th with 7-10 setae. Marginal sclerites indistinct (in some specimens distinct). Cornicle reticulated, 0.29-0.57 as long as 2nd segment of hind tarsus, at most 4/5 as long as base of 6th antennal segment. Cauda knobbed, with 9 or 10 setae.

Alate viviparous female: Body about 1.55 mm. in length. Head and thorax black sclerotic. Antennae (fig. 32, A) about 0.76 as long as body; 3rd segment with 6-10 secondary sensoria, 4th with 1 or 2, and 5th with 0-3; chaetotaxy of 3rd-6th segments 6-9, 2-4, 1-2, 1-2; length of 3rd-6th segments in proportion 18: 12.5: 12: 7+19.5. Abdomen with pale brown bands on all segments, the band on 4th segment bearing 6 or 7 setae; marginal sclerites present. Cornicle 0.56-0.72 as long as 2nd segment of hind tarsus. Other characters as in apterae viviparae.

Specimens examined: Many apterous viviparous females taken at the following localities in Honshû: Ikezuki, Miyagi-ken, 25-v-1966, ex *Salix* sp., M. Miyazaki leg.; Nikkô, Tochigi-ken, 23-vii-1967, ex *Salix* sp.; Tôkyô, 30-vii-1958, ex *Salix* sp., R. Takahashi leg.; Shimonoseki, Yamaguchi-ken, 6-v-1965, ex *Salix* sp., M. Miyazaki leg.

Host plants: Salix babylonica L. (after Shinji, 1935), Salix kinuyanagi Kimura (after Shinji, 1941), Salix koriyanagi Kimura (after Shinji, 1941).

Distribution: Japan (Honshû; Kyûshû).

This species is characterized by the following aspects:—(1) Body small, about 1.23 mm. in length. (2) Dorsal setae few in number, 5-7 on 6th abdominal segment. (3) Caudal setae 9 or 10 in number.

6. Chaitophorus salijaponicus Essig & Kuwana

References. Essig & Kuwana 1918: 84; Mordwilko 1929: 29 [niger]; Börner 1950: 3 [Pseudomicrella jacobi]; ibid. 1952: 52 [Fseudomicrella jacobi]; Stroyan 1957: 339 [niger]; Szelegiewicz 1961: 271 [niger]; ibid. 1968: 69.

Synonyms. Chaitophorus niger Mordwilko, 1929; Pseudomicrella jacobi Börner, 1950.

On the basis of the present material, a redescription is given below:—

Apterous viviparous female: Body colour in life unknown. In mounted specimens head and thorax brown. Antennae brown; 2nd segment on distal part and 3rd-4th segments pale. Abdomen brown; on the middle part and around cornicles pale. Legs pale; tarsi pale brown. Cornicle brown. Cauda pale. Body (fig. 29, F) distinctly reticulated, about 1.67 mm. in length; dorsal setae not furcate at apex. Head: cephalic setae variable in length, the longest seta is 4.9-6.7 times as long as middle breadth of 3rd antennal segment. Antennae about 0.54 as long as body; 3rd segment 2.1-2.7 (mostly 2.4) times as long as base of 6th antennal segment; 6th with processus terminalis 2.2-2.5 (mostly 2.4) times as long as base of the segment; length of 3rd-6th segments in proportion 15:8:9:6+14. Antennal setae slender; 3rd segment with 5-8 setae, of which the longest one is 3.1-4.2 times as long as middle breadth of 3rd antennal segment, 4th with 2-4 setae, and 5th with 1-3 setae. Rostrum short, reaching

a little beyond or just attaining middle coxae; ultimate segment 0.75-0.88 as long as 2nd segment of hind tarsus, with 4 setae besides apical ones. Legs: tibial setae slender, variable in length, the longest seta is 3.7-4.5 times as long as middle breadth of 3rd antennal segment; hind tibiae without pseudosensoria; 1st tarsal segment with 5 setae ventrally. Abdomen: 2nd-6th segments solidly fused, the other segments mutually free; 6th with 11-15 setae between cornicles, the longest seta being 5.5-7.0 times as long as middle breadth of 3rd antennal segment; 7th with 10-12 setae. Cornicle reticulated, 0.37-0.63 as long as 2nd segment of hind tarsus, at most 5/7 as long as base of 6th antennal segment. Cauda knobbed, with 7 setae.

Specimens examined: Some apterous viviparous females taken at Kagoshima, Kagoshima-ken, 28-iv-1965, ex *Salix koriyanagi*, M. Miyazaki leg.

Host plants: Salix integra Thunb. (after Takahashi, 1924) and Salix koriyanagi Kimura. Furthermore, according to the literature the following plants are recorded as hosts:—Salix alba, S. fragilis, S. amygdalina and S. babylonica (in Poland, after Szelegiewicz, 1961); Salix laurina and S. purpurea (in England, after Stroyan, 1957).

Distribution: Japan (Honshû; Kyûshû); Europe.

Specimens examined agree very well with Szelegiewicz's redescription (1961) of *C. niger* Mordwilko, 1929.

7. Chaitophorus saliniger Shinji

References. Shinji 1924: 350; Takahashi 1930: 9 [chinensis]; ibid. 1935: 52 [chinensis]; Tao 1963: 44 [chinensis].

Synonyms. Chaitophorus chinensis Takahashi, 1930. Syn. nov.

On the basis of the present material, a redescription is given below:

Apterous viviparous female: Body blackish brown in life. Antennae pale brown; 1st, 5th and 6th segments blackish brown. Legs pale brown; femora and tibiae on basal part sometimes blackish brown and tarsi blackish brown. Cornicle blackish brown. Cauda pale brown. Body (fig. 29, G) granular on dorsum, about 1.51 mm. in length; dorsal setae at least partially truncate or furcate at apex. Head: cephalic setae variable in length, the longest seta is 4.0-7.0 times as long as middle breadth of 3rd antennal segment, 2-4 times as long as shorter setae on head. Antennae (fig. 33, B) short, 0.43 as long as body; 3rd segment 1.8-2.6 (mostly 2.2) times as long as base of 6th antennal segment; 6th segment with processus terminalis 1.0-2.5 (mostly 1.6) times as long as base of the segment; length of 3rd-6th segments in proportion 11:6:6:5+8. Antennal setae: 3rd segment with 1-3 setae, of which the longest one is 2.7-3.7 times as long as middle breadth of the segment, 4th with 0 or 1, and 5th with 1. Rostrum not surpassing middle coxae; ultimate segment 0.9-1.1 times as long as 2nd segment of hind tarsus, with 2-4 setae besides apical ones. Legs: tibial setae variable in length, the longest seta is 2.9-4.7 times as long as middle breadth of 3rd antennal segment; hind tibiae (fig. 33 C) with small pseudosensoria on swollen part near the base; 1st tarsal segment with 5 setae ventrally. Abdomen: 1st-6th segments almost fused together, 7th segment not well defined from 6th, but 8th well defined; 6th with 16-24 setae between cornicles, the longest seta being 4.7-7.3 times as long as middle breadth of 3rd antennal segment; 7th with 14-18 setae. Marginal sclerites distinct. Cornicle reticulated, 0.14-0.25 as long as 2nd segment of hind tarsus, at most 3/8 as long as base of 6th antennal segment. Cauda faintly constricted, with 7 setae.

Alate viviparous female: Body about 1.51 mm. in length. Head and thorax black sclerotic. Antennae (fig. 33, A) about 0.59 as long as body; 3rd segment with 6-10 secondary sensoria, 4th with 2-4, and 5th with 0 or 1; chaetotaxy of 3rd-6th segments 3-5, 1-3, 1-2, 1-2; length of 3rd-6th segments in proportion 16.5:10:8:6+11. Abdomen with large, black bands on all segments, the band on 4th segment bearing 8-12 setae. Cornicle 0.29-0.77 as long as 2nd segment of hind tarsus. Other characters as in apterae viviparae.

Male: Body smaller, about 1.30 mm. in length; dorsal setae subequal to those of apterae in length, but they are not branched at apex. Head granular on dorsum as in apterae, but abdomen spiculosely imbricated. Antennae about 0.66 as long as body; 3rd segment with 10-15 secondary sensoria, 4th with 9-13, and 5th with 7 or 8; length of 3rd-6th segments in proportion 17:11:8:5+9. Other characters as in apterae viviparae.

Oviparous female: Body larger, about 2.06 mm. in length; dorsal setae longer than those of apterae, not furcate at apex. Head and thorax granular on dorsum, but

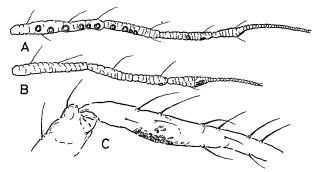

Fig. 33. Chaitophorus saliniger Shinji. Alate viviparous female:—A, 3rd-6th antennal segments. Apterous viviparous female:—B, 3rd-6th antennal segments; C, hind tibia.

abdomen smooth. Antennae short, about 0.39 as long as body; length of 3rd-6th segments in proportion 16:8:7:5.5+10. Abdomen with small sclerites, each of which bears a seta; marginal sclerites smaller. Cornicle smaller. Other characters as in apterae viviparae.

Specimens examined: Many apterous viviparous females taken at the following localities: Honshû—Tôkyô, 28-vii-1959, ex Salix sp., R. Takahashi leg.; Yokohama, Kanagawa-ken, 8-vii-1953, ex Salix sp., K. Sato leg.; Mt. Tanzawa Kanagawa-ken, 9-viii-1961, ex Salix sp., R. Takahashi leg.; Ôsaka, 16-v-1959, ex Salix sp., R. Takahashi leg.; Hiroshima, Hiroshima-ken, 29-iv-1965, ex Salix babylonica, M. Miyazaki leg. Kyûshû—Miyakonojô, Miyazaki-ken, 19-iv-1962, ex Salix sp., T. Tanaka leg.; Yatsushiro, Kumamoto-ken, 20-iv-1965, ex Salix eriocarpa, M. Miyazaki leg. Some alate viviparous females, Ôsaka, 16-v-1959, R. Takahashi leg. 2 males, Hirao, Ôsaka, 25-xi-1959, ex Salix sp., M. Sorin leg. 3 oviparous females, Hirao, Ôsaka, 25-xi-1959, M. Sorin leg.

Host plants: Salix babylonica L., Salix eriocarpa Franch. & Savat. In Formosa Salix babylonica has been recorded as host (after Tao, 1963).

Distribution: Japan (Honshû; Kyûshû); Formosa; China.

This species is not confused with other related ones in Japan, since it is distinct from any others by the presence of small pseudosensoria on a somewhat swollen part near the base of hind tibia.

In the course of the present study I have come to the conclusion that *Chaitophorus chinensis* Takahashi, 1930, should be suppressed as a synonym of *saliniger* Shinji, 1924.

8. Chaitophorus tremulae Koch

References. Koch 1854: 8; Theobald 1929: 14; Börner 1939: 77 [corax]; ibid. 1952: 52 [Eichochaitophorus]; Szelegiewicz 1961: 300; ibid. 1968: 70.

Synonyms. Chaitophorus corax Börner, 1939.

This species is new to Japan. On the basis of the present material, a redescription is given below:—

Apterous viviparous female: Body colour in life unknown. In mounted specimens head and thorax pale brown. Antennae pale brown; 5th segment on distal part and 6th segment brown. Abdomen pale. Legs pale brown; tarsi brown. Cornicle and cauda pale brown. Body (fig. 29, H) scabrous on dorsum, about 1.6 mm. in length;

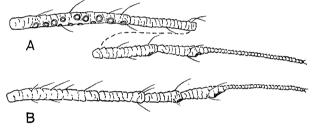

Fig. 34. Chaitophorus termulae Koch. Alate viviparous female:—A, 3rd-6th antennal segments. Apterous viviparous female:—B, 3rd-6th antennal segments.

dorsal setae at least partially truncate or furcate at apex. Head: cephalic setae variable in length, the longest seta is 4.5-8.0 times as long as middle breadth of 3rd antennal segment, 4.0-5.7 times as long as shorter setae on head. Antennae (fig. 34, B) about 0.59 as long as body; 3rd segment 2.1-2.5 (mostly 2.3) times as long as base of 6th antennal segment; 6th with processus terminalis 2.0-2.7 (mostly 2.3) times as long as base of the segment; length of 3rd-6th segments in proportion 16:9:9:7+16. Antennal setae variable in length; 3rd segment with 6-12 setae, of which the longest one is 2.0-3.4 times as long as middle breadth of the segment, 4th with 3-5 setae, and 5th with 2-4 setae. Rostrum reaching to middle coxae; ultimate segment 0.8-1.0 as long as 2nd segment of hind tarsus, with 4 setae besides apical ones. Legs: femora faintly enlarged; tibial setae variable in length, the longest seta is 2.7-5.0 times as long as middle breadth of 3rd antennal segment; hind tibiae without pseudosensoria; 1st tarsal segment with 7 setae ventrally. Abdomen: 1st-6th segments fused, the other segments mutually free; 6th segment with 14-17 setae between cornicles, the longest seta being 4.0-6.8 times as long as middle breadth of 3rd antennal segment, 7th with 12-15 setae. Cornicle reticulated, 0.17-0.20 as long as 2nd segment of hind tarsus, at most 3/13 as long as base of 6th antennal segment. Cauda knobbed, with 6 setae.

Alate viviparous female: Body about 1.85 mm. in length. Head and thorax black sclerotic. Antennae (fig. 34, A) about 0.63 as long as body; 3rd segment with 13 or 14 secondary sensoria, 4th segment without secondary sensoria; chaetotaxy of 3rd-6th segments 9-12, 2-4, 3-5, 2-3; length of 3rd-6th segments in proportion 21:11.5:11:7+18.5. Abdomen with broad, black bands on all segments, the band on 4th segment bearing 14-16 setae; marginal sclerites rather large and intersegmental dots present. Cornicle about 0.5 as long as 2nd segment of hind tarsus. Other characters as in apterae viviparae.

Specimens examined: Many apterous viviparous females taken at Nagano, Ôsaka, 3-, 8-v-1959, ex *Populus* sp., R. Takahashi leg. 2 alate viviparous females, Nagano, Ôsaka, 3-, 8-v-1959, R. Takahashi leg.

Host plants: *Populus* sp. In Europe *Populus tremula* has been recorded as host (after Szelegiewicz, 1961).

Distribution: Japan (Honshû); Europe.

Japanese specimens somewhat differ from European ones in having slightly longer setae on the outer side of 3rd antennal segment. In European specimens the longer setae on the inner side of the 3rd antennal segment are 3-4 times as long as those on the outer side, whereas in Japanese ones they are 2.5-3.0 times as long.

Species of Chaitophorus not included in the key

9. Chaitophorus matsumurai Hille Ris Lambers

References. Matsumura 1917: 376 [salicicolus, nec Essig, 1911]; Hille Ris Lambers 1960: 23.

Host plants: Salix bakko Kimura (after Matsumura, 1917).

Distribution: Japan (Hokkaidô).

This species is excluded from the present key since I have seen no representatives. Judging from the original description, this species resembles *Chaitophorus horii* Takahashi by the body of apterae bearing tubercles and by the body colouration, but it differs from the latter by the number of secondary sensoria.

The aphid mentioned under the name C. salicicolus by Shinji (1941) seems to be another species.

10. Chaitophorus yomefuri Shinji

References. Shinji 1922 b: 732; ibid. 1941: 420.

Host plants: Populus sieboldii Miquel (after Shinji, 1941).

Distribution: Japan (Honshû).

According to the diagnosis given by Shinji (1941), this species is very similar to *Chaitophorus tremulae* Koch, but it may be distinguished from the latter by the length of processus terminalis and by the number of antennal setae.

32. Genus Periphyllus van der Hoeven

References. van der Hoeven 1863: 1; van der Goot 1915: 369 [Chaitophorinella]; Baker 1920: 34; Theobald 1929: 35; Shinji 1941: 139; Hille Ris Lambers 1947: 225; Essig & Abernathy 1952: 1; Börner 1952: 51; Palmer 1952: 94; Eastop 1966: 523.

Synonyms. *Phyllophora* Fernie, 1852, nec Thunberg, 1815 [type-species: *Phyllophora testudinacea* Fernie, 1852]; *Chelymorpha* Clark, 1858, nec Dejean, 1835 [type-

species: Chelymorpha phyllophora Clark, 1858]; Periphyllus van der Hoeven, 1863 [type-species: (Periphyllus testudo van der Hoeven, 1863) = Phyllophora testudinacea Fernie, 1852]; Chaitophorinella van der Goot, 1913 [type-species: Phyllophorus testudinatus Thornt., 1852]; Chaitophorinus Börner, 1930 [type-species: Chaitophorus lyropictus Kessler, 1886]; Chaetophoria Börner, 1940 [type-species: Chaitophorus xanthomelas Koch, 1854]; Chaetophorella Börner, 1940 [type-species: Aphis aceris L., 1746].

Type-species. (Periphyllus testudo van der Hoeven, 1863) = Phyllophora testudinacea Fernie, 1852.

This genus is widely distributed over the world. It is noteworthy that many species produce in summer modified first-instar larvae of resting stage, usually known as "aestivales". Most species of this genus are associated with Aceraceae and some others with Sapindaceae and Hippocastanaceae.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 42, M, the setae being pointed or foliate; marginal setae usually foliate in spring and early summer. Cornicle indistinct.

Host plants: Aceraceae, Hippocastanaceae, and Sapindaceae.

Distribution: Holarctic, Oriental and Australian regions.

Key to the Japanese species of Periphyllus

	200) to the jupaness operior of a section of

Alate viviparous female: Measurements of 10 species in mm. Body 3.01 (2.30–3.61); antennal segments (1st–6th): 0.08 (0.07–0.09), 0.06 (0.05–0.06), 0.69 (0.58–0.81), 0.37 (0.30–0.45), 0.34 (0.24–0.39), 0.13 (0.11–0.17)+0.35 (0.26–0.45); ultimate rostral segment 0.13 (0.11–0.14); hind femur 0.90 (0.68–1.06); hind tibia 1.61 (1.22–1.92); 2nd segment of hind tarsus 0.17 (0.15–0.20); longest seta on head 0.202 (0.197–0.252), that on 3rd antennal segment 0.174 (0.129–0.189), that on 6th abdominal segment 0.242 (0.152–0.288), that on hind tibia 0.250 (0.212–0.288).

Apterous viviparous female: Measurements of 5 species in mm. Body 2.95 (2.68–3.12); antennal segments (1st–6th): 0.09 (0.07–0.09), 0.06 (0.05–0.06), 0.60 (0.58–0.63), 0.31 (0.30–0.32), 0.30 (0.29–0.32), 0.13 (0.12–0.14)+0.27 (0.27–0.29); ultimate rostral segment 0.13 (0.13–0.14); hind femur 0.79 (0.76–0.82); hind tibia 1.28 (1.22–1.33); 2nd segment of hind tarus 0.17 (--); longest seta on head 0.242 (0.202–0.244), that on 3rd antennal segment 0.167 (0.158–0.169), that on 6th abdominal segment 0.293 (0.280–0.301), that on hind tibia 0.250 (0.239–0.258).

Specimens examined: Many alate and apterous viviparous females taken at the following localities: Hokkaidô—Sapporo, 8-vi-1967, ex *Acer mono*. Honshû—Niigata, Niigata-ken, 9-v-1956, K. Shibata leg.; Mt. Kongô, Ôsaka, 30-iv-1961, ex *Acer* sp., R. Takahashi leg. Kyûshû—Hikosan, Fukuoka-ken, 9-v-1957, ex *Acer* sp., S. Takagi leg.

Host plants: Acer carpinifolium Sieb. & Zucc. (after Moritsu, 1958), Acer japonicum Thunb. (after Matsumura, 1917), Acer miyabei Maxim. (after Matsumura, 1917), Acer mono Maxim., Acer palmatum Thunb. (after Matsumura, 1917), Aesculus turbinata Blume (after Takahashi, 1919). Furthermore, according to the literature the following plants have been recorded as hosts:—Acer palmatum (in Australia, after Eastop, 1966), Acer circinatum and Acer macrophyllum (in U.S.A., after Essig & Abernathy, 1952), Acer tricidum (in China, after Tao, 1963).

Distribution: Japan; Korea; China; Australia; New Zealand; Canada; U. S. A.; England; Holland.

This species is common in Japan on several Acer spp.

2. **Periphyllus koelreuteriae** (Takahashi)

References. Takahshi 1919 a: 277 [Chaitophorinella]; ibid. 1919 c: 175 [Chaitophorinella]; Shinji 1927: 46; ibid. 1941: 426; Essig & Abernathy 1952: 77; Tao 1963: 50.

Alate viviparous female: Measurements of one specimen in mm. Body 2.92; antennal segments (1st-6th): 0.09, 0.07, 0.81, 0.42, 0.38, 0.15+0.42; ultimate rostral segment 0.13; hind femur 1.08; hind tibia 1.08; 2nd segment of hind tarsus 0.19; longest seta on head 0.224, that on 3rd antennal segment 0.182, that on 6th abdominal segment 0.264, that on hind tibia 0.310.

Specimes examined: 1 alate viviparous female, Morioka, Iwate-ken, 24-vi-1967, Aesculus turbinata.

Host plants: Aesculus turbinata Blume, Koelreuteria paniculata Laxm. (after Taka-

hashi, 1919a).

Distribution: Japan (Honshû); Formosa; China.

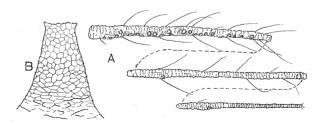

Fig. 35. Periphyllus koelreuteriae (Takahashi). Alate viviparous female:—A, 3rd-6th antennal segments; B, cornicle.

3. Periphyllus kuwanaii (Takahashi)

References. Essig & Kuwana 1918: 82 [Chaitophorus japonica]; Takahashi 1919a: 277 [Chaitophorinella japonica]; ibid. 1919c: 176 [Chaitophorinella]; Shinji 1941: 439 [testudinatus]; Essig & Abernathy 1952: 81.

Synonyms. Chaitophorus japonica Essig & Kuwana, 1918 nec Baker, 1918.

Alate viviparous female: Measurements of 8 specimens in mm. Body 2.12 (1.64–2.44); antennal segments (1st–6th): 0.07 (0.06–0.07), 0.06 (0.05–0.06), 0.47 (0.35–0.53), 0.26 (0.23–0.29), 0.24 (0.21–0.27), 0.11 (0.09–0.12)+0.26 (0.23–0.29); ultimate rostral segment 0.11 (0.09–0.12); hind femur 0.59 (0.45–0.76); hind tibia 1.00 (0.82–1.20); 2nd segment of hind tarsus 0.15 (0.11–0.18); longest seta on head 0.181 (0.154–0.204), that on 3rd antennal segment 0.139 (0.103–0.159), that on 6th abdominal segment 0.174 (0.129–0.206), that on hind tibia 0.180 (0.129–2.06).

Apterous viviparous female: Measurements of 5 specimens in mm. Body 1.74 (1.44-2.42); antennal segments (1st-6th): 0.08 (--), 0.06 (0.06-0.07), 0.38 (0.25-0.47), 0.19 (0.12-0.23), 0.18 (0.11-0.23), 0.10 (0.08-0.11)+0.21 (0.18-0.24); ultimate rostral segment 0.10 (0.08-0.11); hind femur 0.47 (0.33-0.63); hind tibia 0.77 (0.52-1.03); 2nd segment of hind tarsus 0.13 (0.09-0.17); longest seta on head 0.203 (0.161-0.220), that on 3rd antennal segment 0.145 (0.129-0.166), that on 6th abdominal segment 0.208 (0.174-0.220), that on hind tibia 0.165 (0.136-0.202).

Specimens examined: Many alate and apterous viviparous females taken at the following localities: Hokkaidô—Sapporo, 26-v-, 8-vi-1961, ex *Acer mono*, S. Takagi leg.; Abashiri, 6-vi-1956, ex *Acer* sp., S. Takagi leg. Honshû—Towada, Aomori-ken, 22-vi-1967, ex *Acer* sp.; Shirahone, Nagano-ken, 27-vii-1961, ex *Acer* sp., R. Takahashi leg.

Host plants: Acer mono Maxim., Acer pictum var. dissectum Wesmael. (after Essig & Kuwana, 1918).

Distribution: Japan (Hokkaidô; Honshû).

4. Periphyllus viridis (Matsumura)

References. Matsumura 1919: 111 [Chaitophorus]; Shinji 1941: 434.

On the basis of the present material, a brief redescription is given below:-

Alate viviparous female: Body about 3.4 mm. in length. Antennae (fig. 36, A) 0.8-1.0 as long as body; 3rd segment with 17-22 setae, of which the longest one is about 3.8 times as long as middle breadth of the segment, and with 15-27 (mostly 18) secondary sensoria; 4th segment with 7-13 setae, 5th segment with 7 or 8 setae; 6th segment with processus terminalis 2.9-4.0 times as long as the base; length of 3rd-6th segments in proportion 61:43:36:10+36. Rostrum not reaching middle coxae; ultimate rostral segment 0.6-0.7 as long as 2nd segment of hind tarsus, with 1 or 2 pairs of secondary setae. Clypeus with a pair of anterior setae; mandibular lamina with 2 setae. Hind tibiae black, with numerous long setae, of which the longest one is about 5.5 times as long as middle breadth of 3rd antennal segment. First tarsal segment of fore, middle and hind legs with 7, 7, 7 setae respectively. Abdomen without black bands; 6th segment with 15-18 setae between cornicles, the longest seta being about 4.9 times as long as middle breadth of 3rd antennal segment. Cornicle (fig. 36, B) with polygonal reticulation almost over the entire length. Cauda short and rounded, rather a thumbnail-like in shape.

Apterous viviparous female: Differs from the alate viviparous female as follows:-

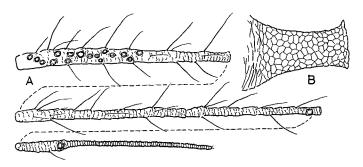

Fig. 36. Periphyllus viridis (Matsumura). Alate viviparous female:—A, 3rd-6th antennal segments; B, cornicle.

Antennae 0.7-0.9 (mostly 0.8) times as long as body; 3rd segment without secondary sensoria; length of 3rd-6th segments in proportion 54:36:31:10+32. Cornicle with reticulation on distal 2/3 part.

Specimens examined: Many alate and apterous viviparous females, Sapporo, Hokkaidô, 8-vi-1961, ex Acer mono, S. Takagi leg.; 26-v-, 8-vi-1967, ex Acer mono.

Host plants: Acer mono Maxim.

Distribution: Japan (Hokkaidô; Honshû).

Trichaitophorus group

On account of the same number of rudimentary gonapophyses, the multicorneal eyes, the somewhat flattened empodial setae and the host association the *Trichaitophorus* group may be placed near the *Chaitophorus* group. This group is characterized by the following features:—Head fused with prothorax. Antennae 5-segmented. Processus terminalis 0.7–1.8 times as long as base of last antennal segment. Ultimate rostral segment with 0–2 secondary setae. Apical tibial setae not differing from other tibial setae in shape. First tarsal segment with 3 ventral setae, and without dorsal

setae. Empodial setae somewhat flattened. Eighth abdominal segment with 6-8 setae. Rudimentary gonapophyses 4 in number.

The embryo of any species of this group has not yet been examined by myself.

33. Genus Trichaitophorus Takahashi

References. Takahashi 1937: 17.

Type-species. Trichaitophorus aceris Takahashi, 1937.

This is probably Asiatic, being represented by the following three species: T. aceris Takahashi from Formosa, T. recurvispinus Hille Ris Lambers & Basu from India and T. koyaensis Takahashi from Japan.

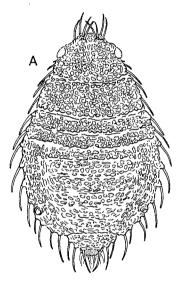

Fig. 37. Trichaitophorus koyaensis Takahashi. Apterous viviparous female:—A, outline of the aphid.

Embryo: Unknown.

Host plants: Aceraceae.

Distribution: Oriental region.

1. Trichaitophorus koyaensis Takahashi

References. Takahashi 1961 b: 248.

Apterous viviparous female: Measurements of one specimens in mm. Body 1.05; antennal segments (1st-5th): 0.05, 0.03, 0.20, 0.07, 0.07+0.10; ultimate rostral segment 0.06; hind femur 0.16; hind tibia 0.26; 2nd segment of hind tarsus 0.08; longest seta on head 0.091, that on hind tarsus 0.038.

Specimens examined: 1 aptera (holotype), Mt. Kôya, Wakayama-ken, 23-ix-1960, ex *Acer rufinerve*.

Host plants: Acer rufinerve Sieb & Zucc.

Distribution: Japan (Honshû).

34. Genus Yamatochaitophorus, gen. nov.

Type-species. Trichaitophorus albus Takahashi, 1961.

The new genus is proposed for the reception of *Trichaitophorus albus* Takahashi, which was originally described from Japan as a feeder of *Acer* sp.

Head fused with pronotum. Eyes consisting of about 10-15 facets. Antennae 5-segmented, about 1/3 as long as body. Processus terminalis a little shorter than base of 6th antennal segment. Secondary sensoria absent. Ultimate rostral segment without secondary setae. Legs: apical tibial setae not differing from the other tibial setae. First tarsal segment bearing 3 ventral setae, without dorsal setae. Empodial setae somewhat flattened. Abdomen: 1st-7th segments solidly fused; each segment bearing 2 marginal setae on either side. Cornicle short, not reticulated. Cauda rounded and anal plate broadly rounded. Alatae unknown.

In most respects this genus (fig. 38, A) is closely allied to *Trichaitophorus* (fig. 37, A), but it differs from the latter by the number of marginal setae and facets, and by the shape and length of dorsal setae.

Embryo: Unknown.

Host plants: Aceraceae. Distribution: Eastern Asia.

1. Yamatochaitophorus albus (Takahashi), comb. nov.

References. Takahashi 1961 a: 8 [Trichaitophorus].

Apterous viviparous female: Measurements of 5 specimens in mm. Body 0.92 (0.82-0.95); antennnal segments (1st-5th): 0.04 (0.03-0.04), 0.03 (--), 0.08 (0.07-0.10), 0.05 (0.04-0.06), 0.06 (0.05-0.06)+0.05 (0.05-0.06); ultimate rostral segment 0.06 (0.05-0.06); hind femur 0.14 (0.13-0.15); hind tibia 0.23 (0.22-0.27); 2nd segment of hind tarsus 0.08 (0.08-0.09); longest seta on head 0.099 (0.071-0.110), that on 6th abdominal segment 0.121 (0.084-0.148), that on hind tibia 0.019 (0.015-0.019).

Specimens examined: Some apterous viviparous females (syntypes of Trichaito-

phorus albus Tak.), Mt. Norikura, Naganoken, 12-viii-1959, ex *Acer* sp., R. Takahashi leg. 5 apterous viviparous females, Suganuma, Gumma-ken, 22-vii-1967, ex *Acer* sp.

Host plants: Acer sp.

Distribution: Japan (Honshû).

This species seems to be restricted to mountainous regions in Japan.

Neophyllaphis group

This is the only group associated with conifers in this subfamily and it is regarded as an old group by Mordwilko (1930), Eastop (1966), Hille Ris Lambers (1967), etc. This group is characterized by the combination of the following characters:—Head of apterae fused with prothorax, and there is no V-shaped suture in the head capsule, while that of alatae not fused with prothorax, but having a V-shaped suture. Eyes of apterae consisting of only triommatidia. Processus ter-

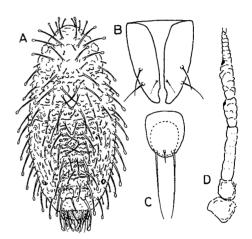

Fig. 38. Yamatochaitophorus albus (Takahashi). Apterous viviparous female:—A, outline of the aphid; B, ultimate rostral segment; C, lst segment of hind tarsus (ventral view); D, antenna.

minalis very short, about 1/4 as long as base of 6th antennal segment. Secondary sensoria annular and without cilia. Ultimate rostral segment without secondary setae. Apical tibial setae not differing from other tibial setae. First tarsal segment of apterae without dorsal setae. Empodial setae hair-like. Dorsal abdominal tubercles absent. Eighth abdominal segment with 4 setae. Cornicle short, ring-like and cauda elongated. Rudimentary gonapophyses 4 in number.

The embryonic chaetotaxy of this group is characterized as follows:—Dorsal abdominal setae very short, pointed; pleural setae present; marginal setae single in number.

35. Genus Neophyllaphis Takahashi

References. Takahashi 1920 a: 19; Shinji 1941: 119; Eastop 1966: 514; Hille Ris Lambers 1967: 55.

Type-species. Neophyllaphis podocarpi Takahashi, 1920.

According to Hille Ris Lambers (1967), this genus comprises eight species and seems to be widely distributed in the tropical and temperate parts of the southern hemisphere.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 42, O, the setae being short, pointed; pleural setae present; marginal setae single. Cornicle invisible.

Host plants: Podocarpaceae.

Distribution: Oriental, Australian, Ethiopian, and Neotropical regions.

1. Neophyllaphis podocarpi Takahashi

References. Takahashi 1920a: 20; ibid. 1921b: 77; Shinji 1922a: 532 [Mindarus podocarpi]; Takahashi 1923: 129; ibid. 1924: 112; Shinji 1941: 288; Tao 1963: 37; ibid. 1964a: 210; Eastop 1966: 516; Hille Ris Lambers 1967: 57.

Synonyms. Mindarus podocarpi Shinji, 1922.

Alate viviparous female: Measurements of 5 specimens in mm. Body 1.60 (1.45–1.81); antennal segments (1st–6th): 0.06 (0.05–0.06), 0.05 (--), 0.45 (0.44–0.50), 0.16 (0.14–0.18), 0.17 (0.15–0.18), 0.12 (0.10–0.13)+0.03 (0.02–0.04); ultimate rostral segment 0.08 (--); hind femur 0.39 (0.37–0.42); hind tibia 0.62 (0.58–0.65); 2nd segment of hind tarsus 0.11 (0.10–0.12); longest seta on head 0.016 (0.013–0.022), that on 3rd antennal segment 0.012 (0.008–0.016), that on 6th abdominal segment 0.019 (0.013–0.023), that on hind tibia 0.023 (0.019–0.026).

Apterous viviparous female: Measurements of 5 specimens in mm. Body 1.81 (1.65-2.02); antennal segments (1st-6th): 0.07 (0.07-0.08), 0.06 (--), 0.29 (0.26-0.30), 0.12 (0.10-0.12), 0.14 (0.13-0.15), 0.12 (0.10-0.13)+0.03 (0.02-0.04); ultimate rostral segment 0.08 (--); hind femur 0.35 (0.31-0.36); hind tibia 0.48 (0.45-0.50); 2nd segment of hind tarsus 0.11 (0.10-0.11); longest seta on head 0.032 (0.026-0.045), that on 3rd antennal segment 0.014 (0.010-0.019), that on 6th abdominal segment 0.026 (0.019-0.032), that on hind tibia 0.027 (0.023-0.032).

Specimens examined: Many apterous viviparous females taken at the following localities: Honshû—Nara, Nara-ken, 10-v-1959, ex *Podocarpus* sp., R. Takahashi leg. Kyûshû—Kagoshima, Kagoshima-ken, 5-viii-1964, ex *Podocarpus macrophyllus*, H. Takada leg.; Uragami, Amami-Ôshima, 6-iii-1964, ex *Podocarpus macrophyllus*, H. Takada leg. Some alate viviparous females, Ôsaka, 28-vi-1956, ex *Podocarpus* sp., R. Takahashi leg.; Hirao, Ôsaka, 12-xi-1960, ex *Podocarpus macrophyllus* var. *maki*, M. Sorin leg.; Amami-Ôshima, 29-iv-1965, ex *Podocarpus macrophyllus*, M. Miyazaki leg. 1 oviparous female, Tsubaki, Wakayama-ken, 28-x-1959, R. Takahashi leg.

Host plants: Podocarpus macrophyllus (Thunb.), Podocarpus macrophyllus var. maki Sieb., Podocarpus sp. In Australia Podocarpus alata has been recorded as host (after Eastop, 1966).

Distribution: Japan (Honshû; Kyûshû); Formosa; China; Malaya; Australia; North America (California).

Isolated genera

The following two genera, *Dasyaphis* and *Parachaitophorus* do not belong to any of the preceding groups.

36. Genus Dasyaphis Takahashi

References. Shinji 1932: 120 [Tuberocorpus]; Takahashi 1938: 13.

Synonyms. *Tuberocorpus* Shinji, 1932, nec Shinji, 1929 [type-species: *Tuberocorpus onigurumi* Shinji, 1932]; *Sinocallis* Tseng & Tao, 1938 [type-species: *Sinocallis mirabilis*, 1938].

This genus is characterized by the following aspects:—Body (fig. 39, F) of apterae with long projections. Head of apterae fused with prothorax. Third and fourth antennal segments of alatae with transversely elongated secondary sensoria. First tarsal

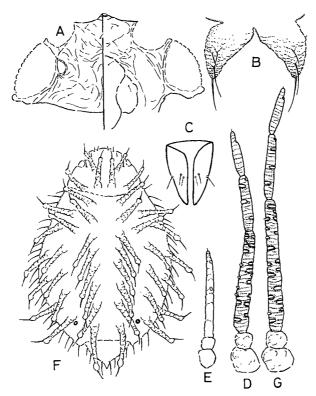

Fig. 39. Dasyaphis onigurumi (Shinji). Alate viviparous female:—A, head; B, anal plate; C, ultimate rostral segment; D, antenna. Apterous viviparous female:—E, antenna; F, outline of the aphid. Alate male:—G, antenna.

segment with 2 or 3 ventral setae.

Embryo: Marginal setae being long, thick and spinal setae short, pointed. Cornicle visible.

Host plants: Juglandaceae. Distribution: Eastern Asia.

1. Dasyaphis onigurumi (Shinji)

References. Shinji 1932: 120 [Tuberocorpus]; Tseng & Tao 1938: 213 [Sinocallis mirabilis];

Takahashi 1938: 13; Shinji 1941: 702 [Tuberocorpus]; Tao 1963: 73 [Tuberocorpus]; Paik 1965: 126 [Tuberocorpus coreanus]; Takahashi 1965: 58.

Synonyms. Sinocallis mirabilis Tseng & Tao, 1938; Tuberocorpus coreanus Paik, 1965. **Syn. nov.**

Alate viviparous female: Measurements of 2 specimens in mm. Body 1.48-1.52; antennal segments (1st-5th): 0.04, 0.03-0.04, 0.19-0.20, 0.10, 0.06-0.07+0.02-0.03; ultimate rostral segment 0.07-0.08; hind femur 0.21-0.22; hind tibia 0.40; 2nd segment of hind tarsus 0.08; longest seta on head 0.010-0.012, that on 3rd antennal segment 0.002, that on 6th abdominal segment 0.008-0.013, that on hind tibia 0.013-0.016.

Apterous viviparous female: Measurements of 5 specimens in mm. Body 1.27 (0.97-1.40); antennal segments (1st-3rd): 0.03 (0.03-0.04), 0.02 (0.02-0.03), 0.14 (0.13-0.17) +0.02 (0.01-0.02); ultimate rostral segment 0.06 (0.05-0.06); hind femur 0.18 (0.15-0.20); hind tibia 0.27 (0.22-0.31); 2nd segment of hind tarsus 0.06 (0.06-0.07); longest seta on 3rd antennal segment 0.003 (0.002-0.006), that on hind tibia 0.016 (0.010-0.019).

Specimens examined: Many apterous viviparous females taken at the following localities: Hokkaidô—Sapporo, 12-vi-1968, ex Juglans sp. Honshû—Oirase, Aomoriken, 21-vi-1967, ex Juglans ailanthifolia; Morioka, Iwate-ken, 24-vi-1967, ex Juglans ailanthifolia; Kaigake, Niigata-ken, 2-vii-1967, Juglans sp.; Nikkô, Tochigi-ken, 21-vii-1967, ex Juglans ailanthifolia; Tôkyô, 28-vii-1958, ex Juglans sp., R. Takahashi leg.; Kyôto, 15-ix-1965, ex Juglans sp., H. Takada leg. Some alate viviparous females, Hokkaidô—Misumai, 27-ix-1967; Sapporo, 28-ix-1967. 2 alate males, Gifu, Gifu-ken, 26-x-1957, R. Takahashi leg.

Host plants: Juglans ailanthifolia Carr., Juglans sp.

Distribution: Japan (Hokkaidô; Honshû); Korea; China.

Judging from the description, *Tubercorpus coreanus* Paik should be suppressed as a synonym of this species.

37. Genus Parachaitophorus Takahashi

References. Takahashi 1937: 90.

Type-species. Patchia spiraeae Takahashi, 1924.

Parachaitophorus Takahashi is the only genus associated with Rosaceae (Spiraea) in the Callipterinae. It is recognized by the following characters:—Body of apterae with long blunt setae. Head of apterae fused with prothorax. Third-5th antennal segments (fig. 40, F) of alatae with oval, protuberant secondary sensoria. First tarsal segment with 2 or 3 ventral setae. Empodial setae hair-like. Cauda (fig. 40, D) elongated, with 2 setae.

Embryo: Dorsal abdominal chaetotaxy as shown in Fig. 42, P, the setae being long, pointed; pleural setae present, shorter than spinal ones. Cornicle invisible.

Host plants: Rosaceae.

Distribution: Eastern Asia.

1. Parachaitophorus spiraeae (Takahashi)

References. Takahashi 1924: 114 [Patchia]; ibid. 1937: 90; ibid. 1961 b: 250.

Alate viviparous female: Measurements of 3 specimens in mm. Body 1.46 (1.29-1.50); antennal segments (1st-6th): 0.06 (--), 0.06 (--), 0.33 (0.32-0.34), 0.14 (0.14-0.16),

0.12 (0.12–0.13), 0.06 (0.06–0.07)+0.17 (0.15–0.17); ultimate rostral segment 0.10 (--); hind femur 0.44 (--); hind tibia 0.75 (0.74–0.77); 2nd segment of hind tarsus 0.11 (0.10–0.12); longest seta on head 0.142 (0.132–0.161), that on 3rd antennal segment 0.083 (0.065–0.097), that on 6th abdominal segment 0.197 (0.181–0.203), that on hind tibia 0.045 (0.041–0.045).

Specimens examined: Many apterous viviparous females, Mt. Kongô, Ôsaka, 30-iv-1961, ex *Spiraea cantoniensis*, R. Takahashi leg.; Kotohira, Kagawa-ken, 21-iv-1965,

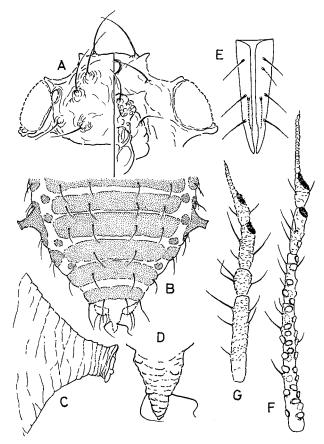

Fig. 40. Parachaitophorus spiraeae (Takahashi). Alate viviparous female:—A, head; B, abdomen; C, cornicle; D, cauda; E, ultimate rostral segment; F, 3rd-6th antennal segments. Apterous viviparous female:—G, 3rd-6th antennal segments.

ex *Spiraea japonica*, H. Takada leg. Some alate viviparous females, Yokohama, Kanagawa-ken, 24-v-, 1-vi-1953, ex *Spiraea japonica*, K. Sato leg.

Host plants: Spiraea cantoniensis Lour., Spiraea japonica L.

Distribution: Japan (Honshû; Shikoku).

This species is easily recognized by the characters given under the generic description.

Species of Callipterinae unknown to the writer

The species which follow below in alphabetical order were described as members of Callipterinae, but their true systematic positions have not yet been known to the writer.

1. Chaitophorus abdominalis Shinji

References. Shinji 1924: 349. Host plants: Betula sp.

2. Chaitophorus fraxinicolus Matsumura

References. Matsumura 1919: 112.

Host plants: Fraxinus longicuspis Sieb. & Zucc.

3. Chaitophorus narae Shinji

References. Shinji 1941: 404.

Host plants: Quercus serrata Thunb.

4. Chaitophorus shidae (Shinji)

References. Shinji 1922 b: 732 [Thomasia]; ibid. 1935 b: 14.

Host plants: Dryopteris crassirhizoma and ferns.

5. Euceraphis betulifoliae Shinji

References. Shinji 1922 b: 730.

Host plants: Betula sp.

6. Mesocallis fagicola Matsumura

References. Matsumura 1919: 103. Host plants: Fagus crenata Blume.

7. Myzocallis alnicola Shinji

References. Shinji 1924: 345.

Host plants: Alnus hirsuta var. sibirica (Fischer).

8. Myzocallis alnifoliae (Shinji)

References. Shinji 1924: 347 [Lutaphis]; ibid. 1941: 304.

Host plants: Alnus firma Sieb. & Zucc. and Alnus hirsuta var. sibirica (Fischer).

9. Sappocallis alnifoliae (Shinji)

References. Shinji 1922 b: 731 [Telocallis].

Host plants: Alnus serrulatoides Callier.

10. Therioaphis ononidis: Shinji

References. Shinji 1941: 362. Host plants: *Trifolium* sp.

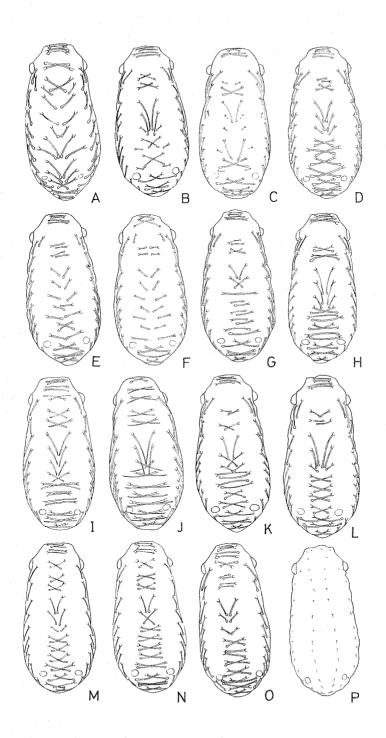

Judging form the literature the aphid stated by Shinji (1941) under the name *Therioaphis ononidis* seems to be not the true *ononidis* Kaltenbach.

11. Therioaphis tilicola Shinji

References. Shinji 1933 c: 164; ibid. 1941: 360.

Host plants: Tilia japonica (Miq.) and Tilia miqueliana Maxim.

Fig. 41. Embryo:—A, Mesocallis sawashibae (Matsumura); B, M. pteleae Matsumura; C, Paratinocallis corylicola, sp. nov.; D, Sappocallis ulmicola Matsumura; E, Tinocallis ulmiparvifoliae Matsumura; F, T. zelkowae (Takahashi); G, Tiliaphis shinae (Shinji); H, Chromocallis nirecola (Shinji); I, Neochromaphis carpinicola (Takahashi); J, N. coryli Takahashi; K, Recticallis nigrostriata (Shinji); L, Myzocallis kuricola (Matsumura); M, Takecallis arundinariae (Essig); N, T. sasae (Matsumura); O, Tuberculatus yokoyamai (Takahashi); P, Shivaphis celti Das.

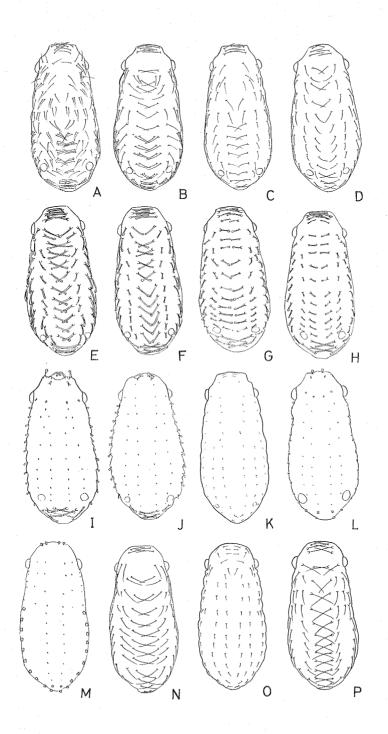

Key to the Japanese genera of Callipterinae*

1.	Apical tibial setae strongly differentiated from other tibial setae, but rarely, weakly differentiated in some genera**. Rudimentary gonapophyses 1 or 2. Mostly on Fagaceae, Ulmaceae,
	and Betulaceae, rarely on bamboos, Lauraceae and Magnoliaceae
_	Apical tibial setae not differentiated from other tibial setae. Rudimentary gonapophyses
	usually 3 or 4, if they are 2, then the antenna 3-5-segmented or the ocular tubercle absent. Mostly on Aceraceae, Salicaceae and Cyperaceae, rarely on Podocarpaceae, Hippocastanaceae,
	Sapindaceae, Rosaceae, and Juglandaceae
2.	Second antennal segment shorter than the 1st. Wax plate usually absent, if present, then
۷.	1st tarsal segment bearing dorsal setae. First tarsal segment often with dorsal setae and
	bearing 5-7 ventral setae. Processus terminalis 0.5-7.0 times as long as base of 6th antennal
	segment, if short processus terminalis produced, then 1st tarsal segment bearing dorsal setae.
	Empodial setae flattened. Ultimate rostral segment with 2-22 secondary setae. Apterae
	absent or present
_	Second antennal segment longer than the 1st. Wax plate present. First tarsal segment
	without dorsal setae and bearing 2-5 ventral setae. Processus terminalis 0.1-0.5 as long as
	base of 6th antennal segment. Empodial steae hair-like or flattened (Phyllaphis). Ultimate
	rostral segment with 2-4 secondary setae. Apterae present (Diphyllaphis group) 26
3.	In embryo the abdominal pleural setae absent and the thoracic marginal setae single. Head
	never with V-shaped suture. Processus terminalis 0.1-2.0 times as long as base of 6th an-
	tennal segment. First tarsal segment always with a pair of dorsal setae. Apterae absent or
	present (Shivaphis and Mesocallis). Mostly on Fagaceae, Betulaceae (Alnus, Carpinus and
	Corylus) and Ulmaceae, rarely on Celtis spp., Tilia spp. and bamboos
	In embryo the abdominal pleural setae present and the thoracic marginal setae double. Head
	sometimes with V-shaped suture. Processus terminalis 0.6-7.0 times as long as base of 6th
	antennal segment. First tarsal segment usually without dorsal setae. Apterae usually pre-
	sent. Mostly on Betulaceae (Alnus and Betula), rarely on Magnoliaceae.
	(Symydobius group) 15
4.	Marginal abdominal setae single on all segments
_	Marginal abdominal setae at least double on anterior segments
5.	Clypeus bearing a finger-like swelling anteriorly. On bamboos 9. Takecallis Matsumura
-	Clypeus normally rounded at front
6.	Abdomen with finger-like tubercles. Spinal setae on abdominal segments III, V, and VII
	show a considerably greater mutual distance than the other spinal setae
	Abdomen without finger-like tubercles. Spinal setae arranged in parallel rows, if they are not
	placed in the arrangement as above, then the body not having finger-like tubercles 8
7.	Media of forewing with two forks. On various plants (mostly on Ulnus spp.)

Fig. 42. Embryo:—A, Symydobius alniaria (Matsumura); B, Clethrobius comes (Walker); C, Callipterinella calliptera (Hartig); D, Euceraphis punctipennis (Zetterstedt); E, Betacallis alnicolens Matsumura, F, Hannabura alnicola Matsumura; G, Neocalaphis magnoliae (Essig & Kuwana); H, N. magnolicolens (Takahashi); I, Boernerina alni Takahashi; J, Betulaphis japonica Takahashi; K, Phyllaphis fagi (Linné); L, Yamatocallis tokyoensis (Takahashi); M, Periphyllus californiensis (Shinji); N, Chaitophorus saliniger Shinji; O, Neophyllaphis podocarpi Takahashi; P, Parachaitophorus spiraeae Takahashi.

^{*} The present key is based on the alate viviparous females unless otherwise stated.

^{**} Betulaphis, Hannabura, Machilaphis, Neocalaphis, and Phyllaphis.

-	Media of forewing with one fork. On Ulmus spp 7. Sappocallis Matsumura
8.	Wax plate present. Processus terminalis about 0.2 as long as base of 6th antennal segment.
	Cornicle short, ring-like. On Celtis spp
_	Wax plate absent. Processus terminalis at least 0.7 as long as base of 6th antennal segment.
	Cornicle rather long, truncated
9.	Dorsal setae rather long, at least 1.5 times as long as middle breadth of 3rd antennal seg-
	ment. Anal plate deeply bilobed. Forewing with brown marking as shown in Fig. 8, C.
	On Tilia spp
_	Dorsal setae short, at most 0.8 as long as middle breadth of 3rd antennal segment. Anal
	plate never deeply bilobed as above. Forewing (figs. 2, F & 3, H) without marking as above.
	Mostly on Carpinus spp. and Corylus spp
10	
10.	Head with wax pores. Marginal sclerites bearing 10-16 setae on anterior 5 segments. Cauda
	bearing 22-25 setae. On <i>Ulmus</i> spp
-	Head without wax pores. Marginal sclerites bearing at most 7 setae. Cauda bearing at most
	17 setae
11.	Finger-like tubercles present
-	Finger-like tubercles absent
12.	Abdomen with paired spinal tubercles. Eighth abdominal segment with 6-12 setae. On
	Quercus spp
-	Abdomen with unpaired median tubercles. Eighth abdominal segment with 6 setae. On
	Alnus spp
13.	Spinal setae (fig. 6, B) on abdominal segments III, V and VII displaced laterally. On
	Corylus spp
	Spinal setae not placed in the arrangement as above
14.	Posterior cephalic setae 4 in number. Processus terminalis 0.2-1.0 (in foreign species 0.5-4.0)
	as long as base of 6th antennal segment. On various plants 3. Myzocallis Passerini
_	Posterior cephalic setae at least 8 in number. Processus terminalis very short, at most 0.3
	as long as base of 6th antennal segment. On Carpinus spp. and Corylus spp
15	Anal plate entire. Processus terminalis shorter than base of 6th antennal segment. First
10.	tarsal segment bearing 7 ventral setae
	Anal plate divided. Processus terminalis often longer than base of 6th antennal segment.
	First tarsal segment bearing 5 or 6 ventral setae, rarely 7 (Boernerina)
1.6	Cauda rounded. Sixth antennal segment with more than 6 setae. Wax plates absent. Apterae
10.	
	present. On Alnus spp. and Betula spp
_	Cauda knobbed. Sixth antennal segment with 1 or 2 setae. Wax plates present. Apterae
. ~	absent
17.	Marginal sclerites bearing 12-24 setae. Antennal setae about 1.5-2.0 times as long as middle
	breadth of 3rd antennal segment. Eighth abdominal segment with 14-16 setae. On Betula
	spp
-	Marginal sclerites bearing 2-6 setae. Antennal setae about 0.5 as long as middle breadth of
	3rd antennal segment. Eighth abdominal segment with 7 or 8 setae. On Betula spp
	19. Euceraphis Walker
18.	Cauda crescent-shaped or elongated
-	Cauda knobbed
19.	Cauda crescent-shaped. Abdomen without tubercles. On Betula spp
_	Cauda elongated. Abdomen (alatae unknown) with small tubercles, each of which bears a
	long, capitate seta. On Betula spp
20.	Head (fig. 14, A) with a broad band on venter. Marginal tubercles on 4th and 5th abdominal
	segments longer than 2nd antennal segment. On Alnus spp. and Betula spp

-	Head without dark band on venter. Marginal tubercles on abdomen shorter than 2nd an-
01	tennal segment
21.	Cornicle very short, at most 2/3 as long as middle breadth of 3rd antennal segment. Ap-
	terae present
-	Cornicle long, at least twice as long as middle breadth of 3rd antennal segment. Apterac
	absent or present (Callipterinella and Hannabura)
22.	Head (fig. 15, A) with a pair of prominent tubercles near anterior margin. Antenna shorter
	than body. Processus terminalis at most 0.9 as long as base of 6th antennal segment
	Secondary sensoria 2-10 in number. On Alnus spp 15. Boernerina Bramsted
_	Head without tubercles. Antenna longer than body. Processus terminalis very long, about
	5 times as long as base of 6th antennal segment. Secondary sensoria 30-40 in number
	On Betula spp
23.	Antenna shorter than body. Abdomen of apterae bearing pointed setae, and with black
	bands on dorsum. On Betula spp 17. Callipterinella v. d. Good
_	Antenna longer than body. Apterae, when produced, with capitate setae and without black
	bands on dorsum of abdomen
24	Processus terminalis 5.0-7.0 times as long as base of 6th antennal segment. Primary sensoria
Δ-1.	circular. On Magnolia spp
_	Processus terminalis at most 3.1 times as long as base of 6th antennal segment. Primary
	sensoria oval or elongated longitudinally
25	First tarsal segment with a pair of dorsal setae. Eighth abdominal segment with 7-12 setae.
20.	Marginal tubercles well developed. Apterae absent. On Alnus spp. and Betula spp
	-
_	First tarsal segment without dorsal setae. Eighth abdominal segment with 15-17 setae.
	Marginal tubercles faintly developed. Apterae present. On Alnus spp
00	De la
26.	Empodial setae flattened. Eighth abdominal segment with 6-8 setae. On Fagus spp
	27. Phyllaphis Koch
-	Empodial setae hair-like. Eighth abdominal segment with 4 setae
27.	First tarsal segment with 2 or 3 ventral setae. Cauda with 2-4 setae. On Quercus spp
-	First tarsal segment with 5 ventral setae. Cauda with 4-6 setae. On Machilus spp
28.	First tarsal segment with 4-7 ventral setae
-	First tarsal segment with 2 or 3 ventral setae
29.	Processus terminalis 0.2-0.3 as long as base of 6th antennal segment. Secondary sensoria
	annular. Ultimate rostral segment without secondary setae. Head of apterae fused with
	prothorax. Eyes of apterae consisting of only 3 facets. On Podocarpaceae
-	Processus terminalis 0.5-4.0 times as long as base of last antennal segment. Secondary sen-
	soria circular or transversely elongate. Ultimate rostral segment mostly with secondary
	setae. Head of apterae not fused with prothorax. Eyes of apterae consisting of many
	facets
30.	Ocular tubercle absent. Cornicle not reticulated. Rudimentary gonapophyses 2. Wax plates
	often present. Body elongated. On Cyperaceae (Saltusaphis group) 31
_	Ocular tubercle present. Cornicle reticulated. Rudimentary gonapophyses 3 or 4. Wax plates
	absent. Body oblong. Mostly on Aceraceae and Salicaceae
31	Body with short, fan-like setae. Antennae and legs densely spined. Empodial setae flattened.
or.	On Carex spp
_	Body with short, pointed setae. Antennae and legs sparsely spined. Empodial setae hair-
_	
20	like or flattened. On Carex spp
34.	American serve not many in number and shorter than middle breadth of ord antennal seg-

	ment. Secondary sensoria transversely elongated, with hairy fringe. Rudimentary gonapo-
	physes 3. Fore femora enlarged. Abdomen without black bands. On Acer spp
-	Antennal setae numerous in number and longer than middle breadth of 3rd antennal seg-
	ment. Secondary sensoria circular or oval, without hairy fringe. Rudimentary gonapophyses
	4. Fore femora normal. Abdomen with black bands (Chaitophorus group) 33
33.	Tibiae without spinules on apical part. Cauda knobbed. Empodial setae usually hair-like.
	Abdomen of apterae mostly with completely sclerotic segments. Embryo never with foliate
	marginal setae. On Salix spp. and Populus spp
-	Tibiae mostly with spinules on apical part. Cauda broadly rounded. Empodial setae flattened.
	Abdomen of apterae never with wholly sclerotic segments. Embryo mostly with foliate marginal
	setae. Mostly on Acer spp. but also on Aesculus spp. and Koelreuteria spp
	32. Periphyllus van d. Hoeven
34.	Cauda elongated, with 2 setae. Eyes of apterae consisting of only 3 facets. Ultimate rostral
	segment with secondary setae. Processus terminalis 1.9-2.0 times as long as base of last an-
	tennal segment. Eighth abdominal segment with 4-6 setae. Empodial setae hair-like. On
	Spiraea spp
	Cauda rounded or knobbed, with 8-15 setae. Eyes of apterae consisting of at least 10 facets.
	Ultimate rostral segment without secondary setae. Processus terminalis 0.2-1.8 times as long
	as base of last antennal segment. Eighth abdominal segment with 6-10 setae. Empodial setae
05	flattened
33.	Body (fig. 39, F) of apterae with long projections. Processus terminalis about 0.2 as long as base of last antennal segment. Cauda knobbed and anal plate divided. Alatae bearing trans-
	•
	versely elongated secondary sensoria on 3rd and 4th antennal segments. On <i>Juglans</i> spp
_	Body of apterae without projections. Processus terminalis 0.7-1.8 times as long as base of
	last antennal segment. Cauda rounded and anal plate not divided. Alatae unknown. On
	Acer spp
36.	Eyes consisting of 20-30 facets. Marginal setae on metanotum and anterior 5 abdominal seg-
٠	ments single. Spinal and pleural setae on abdomen inconspicuous. On Acer spp
	33. Trichaitophorus Takahashi
_	Eyes consisting of 10-15 facets. Marginal setae on metanotum and anterior 5 abdominal
	segments at least double. Spinal and pleural setae on abdomen variable in length, the longest
	seta is at least 5 times as long as middle breadth of 3rd antennal segment. On Acer spp.
