STUDIES ON APHID HYPERPARASITES OF JAPAN, I
APHID HYPERPARASITES OF THE GENUS DENDROCERUS
RATZEBURG OCCURRING IN JAPAN
(HYMENOPTERA : CERAPHRONIDAE)

By Hajimu Takada

Abstract

Six aphid-hyperparasitic species of Dendrocerus occurring in Japan are dealt with. A key to the species, redescriptions, illustrations and biological notes are given on the basis of about 1,300 specimens reared. Host aphid—hyperparasite/primary parasite and primary parasite/host aphid—hyperparasite lists are added. D. laticeps (Hedicke), D. laevis (Ratzeburg) and D. bicolor (Kieffer) are new to Japan. Lygocerus koebelei Ashmead is synonymized with D. carpenteri (Curtis), and L. japonicus Ashmead and D. ratzeburgi Ashmead with D. ramicornis (Boheman). D. laevis is recorded as an aphid hyperparasite for the first time. As hosts of these hyperparasites 50 species of aphids in 35 genera and 36 species of aphidiids in 12 genera are recorded, and 118 different host aphid—primary parasite—hyperparasite relationships are recognized. Most species are widely associated with various groups of Aphidoidea and Aphidiidae, though ramicornis is reared only from lachnid aphids through Pauesia- and Diaeretus-species and this association is unknown for laticeps. Dendrocerus widely inhabits field- to forest-type habitats, but each species shows definite preference of habitats.

INTRODUCTION

It is well known that the primary parasites of aphids are also parasitized by various groups of hyperparasites, and that the latter often reduce the effectiveness of the former in regulating the population of aphids. In the course of his study on Aphidiidae of Japan a lot of specimens of hyperparasites as well as primary parasites have been reared from many kinds of aphids by the present author. This paper, in which the species belonging to the genus *Dendrocerus* Ratzeburg are reported, is the first part of serial works on taxonomy, distribution and host range of aphid hyperparasites occurring in Japan.

1, Ashmead, 1904; 2, Yasumatsu & Moritsu, 1947; 3, Ishii, 1951; 4, Muesebeck & Walkley, 1951; 5, Muesebeck, 1959; 6, Dessart, 1972; 7, Dessart, 1972a; 8, Present confirmation.
The genus *Dendrocerus* is a relatively large group and almost cosmopolitan. The available host records indicate that the species of this genus are either primary parasites of Neuroptera and Diptera or hyperparasites upon Homoptera and Coleoptera through various Hymenoptera. Practically the members of this genus prefer as hosts larvae or pupae that are concealed within small capsules of some kinds (Clausen, 1940). In Table 1 the relationship between the real hosts of *Dendrocerus* and the capsules is given for the species of which the exact host relationship has been determined. When developing as hyperparasites of aphids, the species of *Dendrocerus* are exclusively external and solitary in habit, though a few species are known to be gregarious on other groups of hosts. They oviposit only into mummified aphids containing mature larvae or pupae of Aphidiidae and Aphelinidae (Hagen & van den Bosch, 1968).

Recently, as most of the European species of this genus have been revised and redescribed by Dessart (1972) the author has been able to identify the Japanese forms correctly. So far as he is aware 3 species have been known to occur in Japan as aphid hyperparasites (Ashmead, 1904; Yasumatsu et al., 1946; Yasumatsu & Moritsu, 1947). Furthermore, there are 2 other species which are not hyperparasitic on aphids (Ishii, 1951). In the course of the present study 3 other aphid-hyperparasitic species, which are new to Japan, have been found. In this paper redescriptions, synonymy, some biological notes and host lists of aphid-hyperparasitic *Dendrocerus* occurring in Japan will be given. The host aphids were identified by Dr. V. F. Eastop, Dr. M. Miyazaki and Dr. H. Higuchi and the aphidiids, primary parasites, by the author. The material used in this study are deposited in the collections of the Entomological Institute of Hokkaido University and the Entomological Laboratory of Kyoto Prefectural University.

The present study was partly carried out while the author was enrolled at the Entomological Institute of Hokkaido University, and was resumed at the Entomological Laboratory of Kyōto Prefectural University. This paper constitutes Contribution No. 133 from Entomological Laboratory, Kyōto Prefectural University.

**Classification**

Genus *Dendrocerus* Ratzeburg

This genus is here understood after Dessart (1966 & 1972). In this sense *Lygocerus* Förster, *Prodendrocerus* Kieffer, *Aritomellus* Kieffer and *Neolygocerus* Ishii may be suppressed as synonyms of this genus.

The Japanese aphid-hyperparasitic species may be distinguished by the following key:

Key to the aphid-hyperparasitic species of *Dendrocerus* occurring in Japan (♀ & ♂)

1. Mesoscutum (Fig. 23) with notaulices incomplete
2. Mesoscutum (Figs. 21 & 22) with notaulices complete

---

4
2 Base of 3rd tergite with fine longitudinal striae; fore wing (Fig. 30) with stigma narrow, 1.9—2.1 times as long as wide; legs with coxae yellow; antenna (♀, Fig. 15) with flagellar segments weakly serrate ................... \textit{laticeps} (Hedicke)

- Base of 3rd tergite with coarse longitudinal striae; fore wing (Fig. 31) with stigma wider, 1.8—1.9 times as long as wide; legs with coxae black; antenna (♂, Fig. 16) with flagellar segments more deeply serrate ................... \textit{laevis} (Ratzeburg)

3 Fore wing (Fig. 32) with stigma narrow, 1.9—2.0 times as long as wide; ocellocular line a little shorter than postocellar line, 85—93 (♀) or 77—79 (♂): 100; legs with coxae yellow; abdomen (♀) yellow at basal half; antenna (♂, Fig. 17) with flagellar segments weakly serrate ........................................ \textit{bieolor} (Kieffer)

- Fore wing (Figs. 33—35) with stigma wider, 1.3—1.7 times as long as wide; ocellocular line much shorter than postocellar line, 58—78 : 100 (♀ & ♂); legs with coxae black; abdomen (♀) black entirely .................................................. 4

4 Head in lateral view (Fig. 8) with vertex moderately convex; mesoscutum (Fig. 22) with notaulices converging posteriorly and joining together at posterior end; face in frontal view (Fig. 6) with upper edge of clypeus same level as lower edge of antennal socket and with facial line shorter (♀) than, or equal in length (♂) to, interantennal line; propodeum (Fig. 24) with postcentral area edged semicircular by carinæ; antenna with pedicel (♀, Fig. 14) longer than 1st flagellar segment and with flagellar segments (♂, Fig. 18) moderately serrate. Legs entirely black .................. \textit{carpenteri} (Curtis)

- Head in lateral view (Fig. 7) with vertex strongly convex; mesoscutum (Fig. 21) with notaulices almost parallel and not joining at posterior end ........................................ 5

5 Face in frontal view (Fig. 3) with upper edge of clypeus below lower edge of antennal socket and with facial line almost equal in length (♀) to, or longer (♂) than, interantennal line; propodeum (Fig. 25) with postcentral area edged almost trapezoidal by carinæ; fore wing (Fig. 34) with stigma rather triangular; antenna with pedicel (♀, Fig. 12) longer than 1st flagellar segments and with first 5 flagellar segments (♂, Fig. 19) deeply serrate; legs largely dark brown (♀ & ♂) .... \textit{longispinus} (Yasumatsu & Moritsu)

- Face in frontal view (Fig. 2) with upper edge of clypeus above, or same level as, lower edge of antennal socket and with facial line shorter than interantennal line (♀ & ♂); propodeum (Fig. 26) with postcentral area edged pentagonal by carinæ; fore wing (Fig. 35) with stigma semicircular; antenna with pedicel (♀, Fig. 13) shorter than 1st flagellar segment and with first 5 flagellar segments (♂, Fig. 20) branched; legs, excluding coxae, yellow (♀) or largely dark brown (♂) ................... \textit{ramicornis} (Boheman)

\textit{Dendrocerus laticeps} (Hedicke)

This species is new to Japan. The specimens listed below agree completely with Dessart’s (1972) redescription of \textit{laticeps}.

Redescription: \textit{Female}—Head in lateral view (Fig. 9) with vertex weakly convex and with frons almost flat; eye comparatively large; ocellocular line about 4/5 as long as postocellar line, 79—86 : 100; face in frontal view (Fig. 4) with upper edge of clypeus below lower edge of antennal socket and with facial line almost equal in length to interantennal line, 98—105 : 100. Antenna (Fig. 10) with pedicel distinctly shorter than 1st flagellar segment, 84—96 : 100 and with 2nd to 8th flagellar segments comparatively slender, 1.5—2.1 times as long as wide. Mesoscutum (Fig. 23) with notaulices incomplete; propodeum (Fig. 27)
with postcentral area smooth and edged semicircular by carinae. Base of 3rd tergite with fine longitudinal striae; genitalia with ovipositor sheath (Fig. 37) slender, 5 times as long as wide and acutely pointed at tip. Fore wing (Fig. 30) with stigma narrow, 1.9—2.1 times as long as wide.

Black. Antenna more or less brownish, with scape yellowish brown basally; mouthparts brown. Legs, including coxae, yellow. Wings hyaline, with veins yellowish brown.

Length. Body 1.2—1.6 mm., antenna 0.9—1.3 mm., fore wing 1.0—1.4 mm.

Male—Same as the female except for the following characters.

Facial line longer than interantennal line, 112—121 : 100. Antenna (Fig. 15) with scape slender, 4.7—6.1 times as long as wide and with flagellar segments weakly serrate. Genitalia (Fig. 42) as in figure. Wings with veins darker.

Length. Body 1.3—1.7 mm., antenna 1.4—1.7 mm., fore wing 1.1—1.3 mm.

Material & host*: 1♀1♂, Niigata (A. Ōtake)—Aphidiid sp./Rhopalosiphum padi (Linne)/Triticum aestivum; 1♂, Sapporo (M. Suwa)—Aphidius sp./Aphidiid sp./Beta vulgaris var. rapa; 3♀2♂, Amami-ōshima—Aphidiid amamioshimensis Takada/Acrythosiphon napii (Essig & Kuwana)/Paederia scandens var. mairei; 2♀1♂, Kagoshima (K. Kusigemati)—Aphidius avenae Haliday/Macrosiphum akebiae Shinji/Oryza sativa; 8♀3♂, Kyōto (N. Ueda)—Aphidius gifuensis Ashmead/Myzus persicae (Sulzer)/Raphanus sativus; 1♀, Amami-ōshima (H. Takizawa)—Aphidius longipetiolus Takada/Macrosiphoniella grandicauda Takahashi & Moritsu/Artemisia sp.; 2♀1♂, Kyōto (N. Ueda)—Diaeretiella rapae (M’Intosh)/Lipaphis erysimi (Kaltenbach)/Raphanus sativus; 3♀4♂, Kyōto—Diaeretiella rapae (M’Intosh)/Myzus persicae (Sulzer)/Raphanus sativus; 1♀, Kumamoto—Ephedrus persicae Froggatt/Capitophorus sp./Elaeagnus umbellata; 1♂, Aoshima—Ephedrus plagiator (Nees)/Toxoptera odinae (van der Goot)/Pittosporum tobira; 1♀, Sapporo (K. Kusigemati); 1♂, Amami-ōshima (M. Miyazaki).

In Europe, too, this species is reared from various aphids through Aphidiidae and Aphelinidae (after Dessart, 1972a).

Locality in Japan: Hokkaidō—Sapporo; Honshū—Niigata & Kyōto; Kyūshū—Kumamoto, Aoshima (Miyazaki-ken) & Kagoshima; Ryūkyū—Amami-ōshima.

Geographical distribution: Japan; Europe.

Dendrocerus laevis (Ratzeburg)

On account of the following features the present material may be identified with the species, which is new to Japan.

* Unless otherwise stated the specimens were collected by the author. Primary parasite (=real host), host aphid and host plant are given in the mentioned order. For example, “Aphidius gifuensis Ashmead/Myzus persicae (Sulzer)/Raphanus sativus” means that the hyperparasite concerned was reared from A. gifuensis, a parasite of M. persicae on R. sativus.
Redescription: Male—Head in lateral view with vertex moderately convex and with frons weakly convex; eye small; ocellocular line about 2/3 as long as postocellar line, 61—77 : 100; face in frontal view with upper edge of clypeus below lower edge of antennal socket; facial line longer than interantennal line, 113—126 : 100. Antenna (Fig. 16) with scape 3.4—4.4 times as long as wide and with flagellar segments moderately serrate. Mesoscutum with notaulices incomplete; propodeum (Fig. 28) with postcentral area smooth and edged almost triangular by carinae. Base of 3rd tergite with coarse longitudinal striae; genitalia (Fig. 43) as in figure. Fore wing (Fig. 31) with stigma a little narrow, 1.8—1.9 times as long as wide.

Black. Antenna more or less brownish, with scape yellowish brown at basal half; mouthparts yellowish brown. Legs, excluding coxae black, yellow to yellowish brown, with trochanters, femora and tibiae more or less blackish dorsally. Wings hyaline, with veins dark brown.

Length. Body 1.2 mm., antenna 1.1 mm., fore wing 1.0 mm.

Material & host: 2♀, Kyoto—Trioxys shivaphis Takada/Shivaphis celti Das/Celtis sp.

So far as the author is aware, this is the first host record of the species as a hyperparasite of aphids. According to Dessart (1972) in Europe this species is hyperparasitic on coccids through encyrtid primary parasites.

Locality in Japan: Honshū—Kyōto.

Geographical distribution: Japan; Europe; North Africa.

Dendrocerus bicolor (Kieffer)

This species is new to Japan. The present material agree well with Dessart’s (1972) redescription of the species, except that the relative length of the 1st flagellar segment to the 2nd is shorter.

Redescription: Female—Head in lateral view with vertex weakly convex and with frons almost flat; eye large; ocellocular line a little shorter than postocellar line, 85—93 : 100; face in frontal view (Fig. 5) with upper edge of clypeus below lower edge of antennal socket and with facial line a little shorter, or equal in length to, interantennal line, 84—100 : 100. Antenna (Fig. 11) with pedicel distinctly shorter than 1st flagellar segment, 78—85 : 100 and with 2nd to 8th flagellar segments comparatively slender, 1.3—1.9 times as long as wide. Mesoscutum with notaulices complete, converging posteriorly and joining together at posterior end; propodeum (Fig. 29) with postcentral area smooth (in larger specimens slightly rugose) and edged almost triangular by carinae. Base of 3rd tergite with coarse longitudinal striae; genitalia with ovipositor sheath (Fig. 38) quite slender, 6 times as long as wide and moderately pointed at tip. Fore wing (Fig. 32) with stigma narrow, 1.9—2.0 times as long as wide.

Black. Antenna more or less brownish, with scape yellowish brown basally; mouthparts brown. Abdomen yellowish at basal half. Legs, including coxae,
yellow. Wings hyaline, with veins yellowish brown.

Length. Body 1.4—2.4 mm., antenna 1.1—1.9 mm., fore wing 0.9—1.7 mm.

**Male**—Same as the female except for the following characters.

Ocellocular line: postocellar line = 77—79 : 100; facial line longer than interantennal line, 109—119 : 100. Antenna (Fig. 17) with scape slender, 4.0—4.4 times as long as wide and with flagellar segments weakly serrate. Genitalia (Fig. 44) as in figure. Abdomen entirely black. Wings with veins darker.

Length. Body 1.5—1.7 mm., antenna 1.5—1.7 mm., fore wing 1.2—1.3 mm.

Material & host: 19, Wakamiya—*Ephedrus* sp./*Rhopalosiphoninus deutzi­folicia* Shinji/*Deutzia crenata*; 19, Kyōto—*Pauesia unilachni* (Gahan)/*Schizolachnus* sp./*Pinus densiflora*; 6♀1♂, Kagoshima—*Praon* sp./*Aphid sp./*Orixa japonsica*; 1♂, Nopporo (M. Suwa)—*Praon dorsale* (Haliday)/*Acyrthosiphon* sp./*Trifolium pratense*; 1♀, Sapporo (K. Kusigemati) & 1♀, Tōkyō—*Praon volucre* (Haliday)/*Acyrthosiphon magnoliae* (Essig & Kuwana)/*Sambucus sieboldiana*; 12♀1♂, Sapporo—*Praon volucre* (Haliday)/*Acyrthosiphon syringae* (Matsumura)/*Syringa reticulata*; 1♀, Chitose; 1♂, Sasayama (T. Naito).

Also in Europe this species is known as a hyperparasite of aphids through aphidids (after Dessart, 1972).

Locality in Japan: Hokkaidō—Sapporo, Chitose & Nopporo; Honshū—Tōkyō, Kyōto & Sasayama; Shikoku—Wakamiya (Kōchi-ken); Kyūshū—Kagoshima.

Geographical distribution: Japan; Europe.

*Dendrocerus carpenteri* (Curtis)

*Ceraphron carpenteri* Curtis, Brit. Ent. 8: 249, 1829.

According to Dessart’s redescription mentioned above and to Muesebeck’s identification of part of the present material with the authentic specimens of *carpenteri* the author can definitely identify the present material with the species, one of the most common species of *Dendrocerus* in the Holarctic and Australian regions.

Furthermore, Muesebeck, who has examined also the type of *koebelei* deposited in the U. S. National Museum, suggested to the author that *koebelei* should be suppressed as a synonym of *carpenteri*.

Redescription: **Female**—Head in lateral view (Fig. 8) with vertex moderately convex and with frons weakly convex; eye small; ocellocular line 3/5 as long as postocellar line, 58—61 : 100; face in frontal view (Fig. 6) with upper edge of clypeus same level as lower edge of antennal socket and with facial line shorter than interantennal line, 74—84 : 100. Antenna (Fig. 14) with pedicel longer than
1st flagellar segment, 109—120 : 100 and with 2nd to 8th flagellar segments almost square, 1.2—1.6 times as long as wide. Mesoscutum (Fig. 22) with notaulices complete, converging posteriorly and joining together at posterior end; propodeum (Fig. 24) with postcentral area smooth and edged circular by carinae. Base of 3rd tergite with coarse longitudinal striae; genitalia with ovipositor sheath (Fig. 39) stout, less than 4 times as long as wide and obtuse at tip. Fore wing (Fig. 33) with stigma almost semicircular, 1.6—1.7 times as long as wide.

Body, including antenna, entirely black. Legs black to dark brown, with femora, tibiae and tarsi brownish partly. Wings hyaline, with veins dark brown.

Length. Body 1.4—2.0 mm., antenna 0.9—1.5 mm., fore wing 1.0—1.6 mm.

Male—Same as the female except for the following characters.

Ocellocular line: postocellar line = 62—72 : 100; facial line almost equal in length to interantennal line, 100—103 : 100. Antenna (Fig. 18) with scape 3.1—3.8 times as long as wide and with flagellar segments moderately serrate. Genitalia (Fig. 46) as in figure.

Length. Body 1.1—2.1 mm., antenna 1.0—1.8 mm., fore wing 0.8—1.5 mm.

In other regions this species has been known to be hyperparasitic on various kinds of aphids through aphidiids (see: Dessart, 1972 & 1972b). Location in Japan: Hokkaidō—Memambetsu, Nemuroshibetsu, Bibai, Nagano, Sapporo, Nopporo, Tomakomai & Tōya; Honshū—Atami (after Ashmead, 1904), Sendai, Niigata, Tōkyō, Hatano, Kyōto, Ayabe (Kyōto-fu), Nara, Takarazuka, Kōbe, Himeji, Tottori, Okayama & Kure; Shikoku—Shōdo-shima, Takamatsu, Matsuyama & Kōchi; Kyūshū—Fukuoka (after Yasumatsu et al., 1946), Hiko-san (after Yasumatsu, 1947), Kumamoto, Sasebo, Iki, Nobeoka, Miyazaki, Makurazaki & Kagoshima.

Geographical distribution: Japan; Europe; North America; Australia; New Zealand.

*Dendrocerus longispinus* (Yasumatsu & Moritsu)

*Lygocerus longispinus* Yasumatsu & Moritsu, Mushi 17: 90, 1947 [Japan, host: *Ephedrus interstitialis* Watanabe/*Myzus varians* Davidson].

This species was originally described on the basis of one male specimen. On account of the antennal structure, the wing venation and the coloration the present material should be identified with the species.

Judging from Dessart's (1972) redescription this species comes close to *serricornis* (Boheman, 1832) in the general facies. However, *longispinus* differs from *serricornis* in having the stigma of the fore wing less rounded and the flagellar segments of the male more strongly pointed laterally.

Redescription: **Female**—Head in lateral view (Fig. 7) with vertex strongly convex and with frons weakly convex; eye comparatively small; ocellocular line about 2/3 as long as postocellar line, 62—78: 100; face in frontal view (Fig. 3) with upper edge of clypeus below lower edge of antennal socket and with facial
line almost equal in length to interantennal line, 95—103 : 100. Antenna (Fig. 12) with pedicel longer than 1st flagellar segment, 112—121 : 100 and with 2nd to 8th flagellar segments almost quadrate, 0.9—1.5 times as long as wide. Mesoscutum with notaulices complete, almost parallel and not joining at posterior end; propodeum (Fig. 25) with postcentral area smooth and edged almost trapezoidal (in a few specimens rather triangular) by carinae. Base of 3rd tergite with coarse longitudinal striae; genitalia (Fig. 36) with ovipositor sheath (Fig. 40) slender, 5 times as long as wide and moderately pointed at tip. Fore wing (Fig. 34) with stigma rather triangular, 1.4—1.6 times as long as wide.

Body, including antenna, entirely black. Legs, excluding coxae black, dark brown, with tibiae and tarsi more or less yellowish ventrally. Wings hyaline, with veins dark brown.

Length. Body 1.7—2.9 mm., antenna 1.2—2.0 mm., fore wing 1.3—2.3 mm.

**Male**—Same as the female except for the following characters.

Facial line longer than interantennal line, 116—119 : 100. Antenna (Fig. 19) with scape stout, 2.6—2.7 times as long as wide and with flagellar segments deeply serrate. Genitalia (Fig. 45) as in figure. Legs darker.

Length. Body 1.6—3.1 mm., antenna 1.3—2.2 mm., fore wing 1.3—2.3 mm.

Material & host: 3♀, Sapporo & 2♀, Sandan-kyō (M. Miyazaki)—*Aphidius areolatus* Ashmead/*Periphyllus* sp./*Acer* sp.; 1♀3♂, Sendai & 2♀2♂, Takamatsu—*Aphidius areolatus* Ashmead/*Periphyllus californiensis* (Shinji)/*Acer* sp.; 5♀4♂, Kyōto—*Diaeretus leucopterus* (Haliday)/*Eulachnus thunbergii* Wilson/*Pinus thunbergii*; 2♀2♂, Kyōto—*Ephedrus nacheri* Quilis/*Rhopalosiphoninus deutziafoliae* Shinji/*Deutzia crenata*; 1♀, Kyōto—*Pauesia* sp./*Cinara* sp./*Abies firma*; 3♂, Tōkyō (H. Mitake (H. Takizawa); 2♀, Kyōto; 3♀1♂, Kagoshima (H. Takizawa).

Locality in Japan: Hokkaidō—Yūni & Sapporo; Honshū—Sendai, Tōkyō, Mt. Mitake (Tōkyō-to), Kyōto, Nara, Kōbe & Sandan-kyō (Hirosima-ken); Shikoku—Takamatsu; Kyūshū—Fukuoka (after Yasumatsu & Moritsu, 1947) & Kagoshima.

Geographical distribution: Japan.

**Dendrocerus ramicornis** (Boheman)

**Lygocerus japonicus** Ashmead, J. N. Y. Ent. Soc. 12: 70, 1904 [Japan, host: *Lachnus* sp.]. Syn. nov.

**Lygocerus japonicus** : Yasumatsu et al., Mushi 17: 10, 1946 [Japan, host: *Aphidius salignae* Watanabe / *Tuberolachnus saligna* Gmelin].

**Prodendrocerus ratzeburgi** : Yasumatsu et al., Mushi 17: 11, 1946 [Japan, host: *Aphidius salignae* Watanabe / *Tuberolachnus saligna* Gmelin].

The present material agree completely with Dessart's (1972) redescription of *ramicornis*.

Judging from the original description and host record, *japonicus* which was described on the basis of 2 female specimens appears to be identical with the present species. Furthermore, Dessart (1966 & 1972) suggested that *ratzeburgi* might be a synonym of *ramicornis*. Muesebeck, who has kindly compared representatives of the present material with the types of *japonicus* and *ratzeburgi* deposited in the U. S. National Museum, informed the author that the female and male are identical with the types of *japonicus* and *ratzeburgi*, respectively, so that both *japonicus* and *ratzeburgi* should be suppressed as synonyms of *ramicornis*.

Redescription: **Female**—Head in lateral view with vertex strongly convex and with frons weakly convex; eye comparatively small; ocellocular line about 2/3 as long as postocellar line, 63-67 : 100; face in frontal view (Fig. 2) with upper edge of clypeus above, or same level as, lower edge of antennal socket and with facial line much shorter than interantennal line, 62-69 : 100. Antenna (Fig. 13) with pedicel shorter than 1st flagellar segment, 76-93 : 100 and with 2nd to 8th flagellar segments almost quadrate, 1.3-1.7 times as long as wide (scape without a little tooth as Ashmead (1904) pointed out in the original description of *ratzeburgi*). Mesoscutum (Fig. 21) with notaullices complete, almost parallel and not joining at posterior end; propodeum (Fig. 26) with postcentral area rugose and edged pentagonal by carinae. Base of 3rd tergite with coarse longitudinal striae; genitalia with ovipositor sheath (Fig. 41) slender, 5 times as long as wide and moderately pointed at tip. Fore wing (Fig. 35) with stigma almost semicircular, 1.5-1.8 times as long as wide.

Black. Scape at extreme base and mouthparts brownish. Legs, excluding coxae black, yellow to yellowish brown. Wings hyaline, with veins dark brown.

Length. Body 1.8-3.4 mm., antenna 1.2-2.3 mm., fore wing 1.3-2.4 mm.

**Male**—Same as the female except for the following characters.

Ocellocular line : postocellar line = 58-63 : 100; facial line : interantennal line = 81-83 : 100. Antenna (Fig. 20) with scape stout, 2.0-2.5 times as long as wide and with first 5 flagellar segments with lateral branches; 5th lateral branch reaching only base of 7th flagellar segment in small specimens but the apical half in larger ones. Genitalia as figured (Fig. 47). Generally darker in colour. Scape entirely black. Legs dark brown to brown.
Length. Body 1.4—2.4 mm., antenna 1.1—1.7 mm., fore wing 1.2—1.8 mm.

Material & host: 1♀, Sapporo—*Diaeretus leucopterus* (Haliday)/*Eulachnus thunbergii* Wilson/*Pinus thunbergii*; 1♂, Kyōto—*Pauesia* sp./*Cinara* sp./*Abies firma*; 2♀1♂, Tōkyō (H. Takizawa)—*Pauesia* sp./*Cinara* sp./*Chamaecyparis pisifera*; 2♀1♂, Kyōto & 5♀1♂, Kōbe—*Pauesia abietis* (Marshall)/*Cinara pineti* (Koch)/*Pinus densiflora*; 2♀2♂, Kyōto—*Pauesia japonica* (Ashmead)/*Lachnus tropicalis* (van der Goot)/*Quercus* sp.; 3♀, Nopporo—*Pauesia jezoensis* (Watanabe)/*Lachniella costata* (Zetterstedt)/*Picea jezoensis*; 3♀, Kyōto—*Pauesia konoi* (Watanabe)/*Cinara longispinosa* (Matsumura)/*Abies firma*; 1♀1♂, Kyōto—*Pauesia momicola* Watanabe & Takada/*Pauesia* sp./*Abies firma*; 1♀, Sapporo—*Pauesia pini* (Haliday)/*Cinaria laricis* (Walker)/*Larix leptolepis*; 5♂, Kyōto—*Pauesia unilachni* (Gahan)/*Schizolachnus* sp./*Pinus densiflora*.

This species is reared from *Pineus pini* Macq. (Adelgidae) in Finland (Hellén, 1966), which is the only known host of the species in Europe.

Locality in Japan: Hokkaido—Sapporo & Nopporo; Honshū—Atami (after Ashmead, 1904), Tōkyō, Kyōto & Kōbe; Kyūshū—Fukuoka (after Yasumatsu et al., 1946).

Geographical distribution: Japan; Europe.

Species of *Dendrocerus* not hyperparasitic on aphids

*Dendrocerus* (?) *chilocori* (Ishii)

*Lygocerus chilocori* Ishii, Ōyō-Dōbutsu. Zasshi 16: 95, 1951 [Japan, host: *Homalotylus flavinus* Dalm. (Encyrtidae)/*Chilocorus kawanai* Silv. (Coccinellidae)].

*Dendrocerus* (?) *koyamae* (Ishii)

**Biological notes**

Geographical distribution

The geographical distribution within Japan and in the world of the aphid-hyperparasitic *Dendrocerus*-species occurring in Japan is summarized in Table 2. Except *laevis* which is recorded only from Honshū these species are widely distributed in the main lands of Japan. *Latticeps* is known to occur also in Ryūkyū. Of the 6 species only *longispinus* is endemic in Japan, *carpenteri* is Holarctic and Australian, and the other species are Palaearctic in distribution.

Habitat distribution

Like the aphid primary parasites an aphid hyperparasite also shows definite preference for a certain type of habitat. On the basis of the reared material given in the present paper and other sources of data (unpublished) the range of occupied habitats of the aphid-hyperparasitic *Dendrocerus*-species occurring
Table 2. Geographical distribution of aphid hyperparasites of *Dendrocerus* occurring in Japan.

1, Muesebeck & Walkley, 1951; 2, Dessart, 1972; 3, Dessart, 1972b.

Fig. 1. Habitat distribution of aphid hyperparasites of *Dendrocerus* occurring in Japan.

in Japan is shown in Figure 1.

Species of *Dendrocerus* widely inhabit field- to forest-type habitats. On the basis of the range of their occupied habitats the Japanese species may be divided into 4 groups as follows:— Species occurring mostly in field- to intermediate-type habitats and rarely in the forest-type: *laticeps* and *carpenteri*; Species occurring mostly in intermediate-type habitats: *bicolor* and perhaps *laevis*; Species occurring in intermediate- to forest-type habitats and not in the field-type: *longispinus*; Species occurring mostly in forest-type habitats, less frequently in the intermediate-type and never in the field-type: *ramicornis*.

**Parasitism and host**

As mentioned in Introduction some species of *Dendrocerus* are primary
parasites of Neuroptera and Diptera and others are obligatory hyperparasites of Homoptera and Coleoptera through various Hymenoptera. Such a great diversity in host and mode of parasitism may be understood from their consistent habit: they attack insect larvae or pupae that are concealed under small capsules of some kinds (see: Table 1). When developing as hyperparasites of aphids, species of *Dendrocerus* are external and solitary in habit and oviposit upon the mature larvae or pupae of Aphidiidae and Aphelinidae living in mummified aphids.

The host relationship of the aphid-hyperparasitic *Dendrocerus*-species occurring in Japan is summarized in Table 3. Most species are widely associated with various groups of Aphidoidea and Aphidiidae. However, *ramicornis* which prefers forest-type habitats is hyperparasitic exclusively on lachnid aphids through aphidiids of *Pauesia* and *Diaeretus*. On the other hand, *laticeps* has not been reared from that series of host association.

**Table 3. Host range of aphid hyperparasites of *Dendrocerus* occurring in Japan.**

D. carpenteri (Curtis)
Aphidius amamioshimensis Takada/Acyrthosiphon nipponicus (Essig & Kuwana)
D. laticeps (Hedicke)
Aphidius areolatus Ashmead/Periphyllus sp. & P. californiensis (Shinji)
D. carpenteri (Curtis)
D. longispinus (Yasumatsu & Moritsu)
Aphidius avenae Haliday/Macrosiphum akebiae Shinji & Rhopalosiphum padi (Linné)
D. carpenteri (Curtis)
D. laticeps (Hedicke)
Aphidius gifuensis Ashmead/Myzus persicae (Sulzer)
D. carpenteri (Curtis)
D. laticeps (Hedicke)
Aphidius longisetulos Takada/Macrosiphoniella grandicauda Takahashi & Moritsu
D. carpenteri (Curtis)
D. laticeps (Hedicke)
Aphidius salicis Haliday/Cavariella araliae Takahashi & C. salicivora (Matsumura)
D. carpenteri (Curtis)
Aphidius sicarius Mackauer/Callipterinella calliptera (Hartig)
D. carpenteri (Curtis)
Areopraon nipponicum Takada?/Mindarus japonicus Takahashi
D. carpenteri (Curtis)
Calaphidius watanabei (Takada)/Mansakia shirakabae (Monzen)
D. carpenteri (Curtis)
Diaeretiella rapae (M’Intosh)/Brevicoryne brassicae (Linné), Lipaphis erysimi (Kaltenbach) & Myzus persicae (Sulzer)
D. carpenteri (Curtis)
D. laticeps (Hedicke)
Diaeretus leucopterus (Haliday)/Eulachnus thunbergii Wilson
D. carpenteri (Curtis)

* Restricted to records in Japan.
D. longispinus (Yasumatsu & Moritsu)
D. ramicornis (Boheman)

Dyscritulus sp./Periphyllus sp.
D. carpenteri (Curtis)

Ephedrus sp./Rhopalosiphoninus deutzifolii (Shinji)
D. bicolor (Kieffer)

Ephedrus spp./Aphis sp., A. craccivora Koch, A. norii Boyer, A. spiraecola Patch, Capitophorus sp., Dactynotus cephalonopli Takahashi, Hyalopterus pruni (Geoffroy), Macrosiphum akebiae Shinji, M. ibareae Matsumura, Parachaitophorus spiraeae (Takahashi), Rhopalosiphum padi (Liné) & Toxoptera odinae (van der Goot)
D. carpenteri (Curtis)

Ephedrus nacheri Quilis/Hyalopterus pruni (Geoffroy) & Rhopalosiphoninus deutzifolii (Shinji)
D. carpenteri (Curtis)
D. longispinus (Yasumatsu & Moritsu)

Ephedrus persicæ Froglatt/Aphis spiraecola Patch, Capitophorus sp., C. hippophaæ (Walker), Macrosiphum akebiae Shinji, Myzus varians Davidon & Tuberocephalus sp.
D. carpenteri (Curtis)
D. laticeps (Hedicke)
D. longispinus (Yasumatsu & Moritsu)

Ephedrus plagiator (Nees)/Acyrthosiphon magnolæ (Essig & Kuwana), Aphis spiraecola Patch, Macrosiphum ibareae Matsumura, Melanaphis bambusae (Fullaway), Rhopalosiphoninus deutzifolii (Shinji) & Toxoptera odinae (van der Goot)
D. carpenteri (Curtis)
D. laticeps (Hedicke)

Ephedrus saliciæ Takada/Cavariella saliciæ (Matsumura)
D. carpenteri (Curtis)

Lysaphidus matusayamensis Takada/Colorado sp.
D. carpenteri (Curtis)

Lysaphidus pleotrichosphorii Takada/Pleotrichosphorus glandulosus (Kaltenbach)
D. carpenteri (Curtis)

Lysiphlebus japonicus Ashmead/Toxoptera odinae (van der Goot)
D. carpenteri (Curtis)

Pauesa spp./Cinara spp. on Abies firma
D. carpenteri (Curtis)
D. longispinus (Yasumatsu & Moritsu)
D. ramicornis (Boheman)

Pauesa sp./Cinara sp. on Chamaepyrus pisifera
D. carpenteri (Curtis)
D. longispinus (Yasumatsu & Moritsu)
D. ramicornis (Boheman)

Pauesa sp./Cinara sp. on Pinus densiflora
D. longispinus (Yasumatsu & Moritsu)

Pauesa abietis (Marshall)/Cinara pineti (Koch)
D. carpenteri (Curtis)
D. longispinus (Yasumatsu & Moritsu)
D. ramicornis (Boheman)

Pauesa akamatsucola Takada/Cinara pineti (Koch)
D. carpenteri (Curtis)

Pauesa infulata (Haliday)/Cinara sp.
D. longispinus (Yasumatsu & Moritsu)

Pauesa japonica (Ashmead)/Lachnis tropicalis (van der Goot)
D. longispinus (Yasumatsu & Moritsu)
D. ramicornis (Boheman)

Pauesia jezoensis (Watanabe)/Lachniella costata (Zetterstedt)
D. ramicornis (Boheman)

Pauesia konoi (Watanabe)/Cinara longipennis (Matsumura)
D. longispinus (Yasumatsu & Moritsu)
D. ramicornis (Boheman)

Pauesia momicola Watanabe & Takada/Cinara sp.
D. longispinus (Yasumatsu & Moritsu)
D. ramicornis (Boheman)

Pauesia pini (Haliday)/Cinaria laricis (Walker)
D. carpen teri (Curtis)
D. ramicornis (Boheman)

Pauesia salignae (Watanabe)/Tuberolachnus salignus (Gmelin)
D. carpen teri (Curtis)
D. ramicornis (Boheman)

Pauesia unilachni (Gahan)/Schizolachnus sp.
D. bicolor (Kieffer)
D. carpen teri (Curtis)
D. longispinus (Yasumatsu & Moritsu)
D. ramicornis (Boheman)

Praon spp./Acrythosiphon ibotum (Essig & Kuwana), A. solani (Kaltenbach), Cavariella salicicola (Matsumura), Dactynotus gobonis (Matsumura), Macrosiphum ibarae Matsumura, Myzus boehmeriae Takahashi & M. varians Davidson
D. carpen teri (Curtis)

Praon capitophori Takada/Capitophorus sp.
D. carpen teri (Curtis)
D. longispinus (Yasumatsu & Moritsu)

Praon dorsale (Haliday)/Acrythosiphon sp. & Indomegoura indica (van der Goot)
D. bicolor (Kieffer)
D. carpen teri (Curtis)

Praon flavinode (Haliday)/Euceraphis punctipennis (Zetterstedt)
D. carpen teri (Curtis)

Praon volucre (Haliday)/Acrythosiphon magnoliae (Essig & Kuwana), A. syringae (Matsumura) & Unisitobion sorbi (Matsumura)
D. bicolor (Kieffer)
D. carpen teri (Curtis)
D. longispinus (Yasumatsu & Moritsu)

Trioxys euceraphis Takada/Euceraphis punctipennis (Zetterstedt)
D. carpen teri (Curtis)

Trioxys myzocallis Takada/Myzocallis pilosus Takahashi
D. longispinus (Yasumatsu & Moritsu)

Trioxys shivaphis Takada/Shivaphis celti Das
D. laevis (Ratzeburg)

Acknowledgements

The author wishes to express cordial thanks to Dr. C. Watanabe and Dr. S. Takagi (Hokkaido University) for their kindness in reading through this manuscript, and to Prof. M. Sasakawa (Kyoto Prefectural University) for his encouragement. He is especially obliged to Dr. C. W. F. Muesebeck (U. S.
National Museum) for his helpful suggestion, and to Dr. V. F. Eastop (British Museum), Dr. M. Miyazaki (The National Grassland Research Institute) and Dr. H. Higuchi (Hokkaidó University) for their kindness in identifying the host aphids. Many thanks are also due to the following entomologists for their kindness in offering valuable specimens: Dr. K. Kusigemati (Kagoshima University), Mr. K. Hashimoto (Yaku-shima High-School), Dr. H. Higuchi and Mr. M. Suwa (Hokkaidó University), Dr. K. Kamijo (Hokkaidó Forest Experiment Station), Mr. H. Torikura (Hokkaidó Agricultural Experiment Station), Mr. H. Takizawa (The Tobacco Experiment Station), Dr. M. Miyazaki, Dr. T. Naito (Kôbe University) and Mr. N. Ueda (Kyôto Prefectural University).
