(Received February 1997)

Abstract : Meteorological and sea-ice studies were carried out on a landfast sea-ice at Kleye Strait, northern Sakhalin during the winter of 1994-1995, as part of the Japan- Russia cooperative research project "Sea Ice Studies off the Okhotsk Sea Coast of Sakhalin". Observations of meteorological and sea-ice variables obtained from this experimental site are summarized in this paper. The general atmospheric variables near the experimental site through all the year round are described.

要旨：「日本・ロシア両国によるオホーツク海・サハリン沖海水の共同調査」の一環として、北サハリンのチャイボ湾とオホーツク海を結ぶクレイエ海峡の海氷上で、気象・海水の観測調査を1994年から1995年の冬季に行なった。本報告では、クレイエ海峡の海氷上で得られた気象及び海氷の観測資料を提供する。また、結氷期、非結氷期を通しての通年のクレイエ海峡周辺の気象観測資料も提供する。

I. Introduction

As part of the Japan-Russia cooperative research project, "Sea Ice Studies off the Okhotsk Sea Coast of Sakhalin", meteorological and sea-ice studies were carried out on a landfast sea-ice at Kleye Strait, northern Sakhalin (Fig. 1) during the period from December 1994 to April 1995 to characterize sea ice formation in northern Sakhalin through the ice-covered season. Meteorological variables such as air temperature, humidity, wind speed and direction, radiation and snow/ice/water temperatures were obtained over the landfast sea ice at Kleye Strait. Observations of meteorological variables such as air temperature, humidity, wind speed and direction and radiation for the ice-free season from May through November were obtained at Chaivo Research Station, located near the shore of Kleye Strait. The general meteorological variables such as air temperature, wind speed and direction are obtained from Val Meteorological Station, located near Chaivo Bay (Fig. 1). The three-year records for the period from 1992 to 1994 obtained at Val Meteorological Station are also shown in this report. Observations of meteorological and sea-ice variables obtained in this study are summarized in Table 1. Prior to this study, field experiments of meteorological and sea-ice studies were carried out on the landfast sea-ice at Kleye Strait during the winters of 1992 to 1994, as part of the Japan-Russia cooperative research project, "Sea Ice Studies off the Okhotsk Sea Coast of Sakhalin". Some of the meteorological variables and sea-ice characteristics obtained from those three-year field experiments were reported in Shirasawa *et al.* (1994).

II. Meteorological variables at Val Meteorological Station

The Val Meteorological Station is located near Chaivo Bay, connected to the Sea of Okhotsk through Kleye Strait (Fig. 1). The station is run all the year round to provide general meteorological variables such as air temperature, wind speed and direction every six hours. Time series records of daily mean air temperature and wind speed during the period from 1 January 1992 to 31 December 1994 are shown in Fig. 2. It is shown from those three-year records that the daily mean air temperature decreases below zero from mid- or late October and reaches to -30°C . The temperature increases above zero from late April or early May and

reaches to 20 °C in July or August. The wind is relatively stronger in the winter than in the summer. Yearly windroses are shown in Fig. 3, indicating that the predominant wind direction was NW.

III. Meteorological variables at Chaivo Research Station

The Chaivo Research Station (52°21.50'N, 143°11.93'E) is located near the shore of Kleye Strait, which links Chaivo Bay to the Sea of Okhotsk (Fig. 1). The Chaivo Research Station is operated all the year round by the Sakhalin Oil and Gas Institute. A miniature meteorological station (Data Logger SQ-1201, Grant Instruments Ltd.) was installed on the roof of Chaivo Research Station about 6 m high from the ground in order to obtain general meteorological variables such as air temperature, humidity, wind speed and direction and radiation through all the year round. The downward long-wave radiation (Model MS-200, Eiko-seiki Co., Ltd. and Data Logger KADEC-UP, Kona Systems, Co., Ltd.) was recorded at an interval of 10 min during the period from 0000 JST (Japanese Standard Time) on 18 March to 2350 JST on 6 April 1994, and is shown in Fig. 4. The downward long-wave radiation ranged between 0.15 and 0.3 kWm^{-2} and its range was similar to those obtained during the period from January to March in 1993 at Chaivo Research Station (Shirasawa et al., 1994).

Time series records of air temperature at 100 cm height from the roof of Chaivo Research Station (at 700 cm high from the ground), humidity at 100 cm height, wind speed and direction at 210 cm height, and radiation at 85 cm height are shown in Fig. 5 and listed in Table 2. During the experimental period from 9 April to 30 November 1994, the maximum air temperature was about 27 °C, and relatively stronger winds were observed in October and November. A windrose during the sampling period is shown in Fig. 6, indicating that the predominant wind direction was WNW and S.

In this report all time is used in the Japanese Standard Time (JST). The wind direction is used in reference to the magnetic north, which is deviated 14° from the true north. The threshold value of wind speed is used as 0.3 m/s.

IV. Meteorological and sea-ice observations at Kleye Strait during winter of 1994-1995

An experimental site was located on the fast sea ice at Kleye Strait near Chaivo Research Station (Fig. 1). The width of the strait near the experimental site was about 1 km. To examine the thermal regime of the sea ice sheet covered with and/or without a snow layer, two testing

areas were occupied along the cross-strait line during the ice-covered period from 11 December 1994 to 29 April 1995. The one testing area was set as a snow-covered area under the natural condition, and another was set as a snow-removed area where the surface was kept free from new snowfall all the time during the sampling period (Fig. 1). Observations of meteorological and sea-ice variables obtained from this study are summarized in Table 1.

A meteorological pole was set up near the natural area (52°21.16'N, 143°11.77'E) (Fig. 1). Installed on the pole (Data Logger SQ-1201, Grant Instruments Ltd.) were anemometers at 101 and 216 cm above the surface, thermometers to measure air temperatures and humidity sensors at 100 and 190 cm above the surface, incoming and reflected solar radiation sensors, and radiative temperature sensor to measure the surface brightness temperature (Model THI-500L, Tasco Japan Ltd. and Data Logger KADEC-UII, Kona Systems, Co., Ltd.). The data were recorded at an interval of 1 h. Daily values of surface and air temperatures and humidities, and of wind speed and incoming and reflected solar radiations are shown in Figs. 7 and 8, respectively, and listed in Table 3. A windrose during the period from December 1994 to April 1995 is shown in Fig. 9, indicating that the predominant wind direction during the winter was WNW.

At the natural area, one thermistor chain (Data Logger SQ-1206, Grant Instruments Ltd.) was installed in the 21-cm thick fast ice to measure air/snow/ice/water temperatures under the natural condition (Fig. 1). A total of sixteen thermistor sensors were installed at the snow-ice interface (0 cm), at the heights of 50, 20 and 10 cm above, and 10, 20, 30, 40, 42.5, 45, 47.5, 50, 55, 60, 65 and 70 cm below the snow-ice interface. The data were recorded at an interval of 2 h. Daily mean, maximum and minimum values of those air/snow/ice/water temperatures obtained with the sixteen thermistors are shown in Fig. 10 and listed in Table 4.

At the snow-removed area, the surface brightness temperature (Model THI-500 L, Tasco Japan Ltd. and Data Logger KADEC-UII, Kona Systems, Co., Ltd.) and the reflected radiation sensor (Data Logger KADEC-UP, Kona Systems, Co., Ltd.) were installed on the center of an approximately 10 m × 10 m area in the snow-removed area (Fig. 1). Another thermistor chain (Data Logger SQ-1206, Grant Instruments Ltd.) was installed in the center of the snow-removed area. A total of sixteen thermistor sensors were installed at the air-ice interface (0 cm) and at the depths of 10, 20, 30, 40, 42.5, 45, 47.5, 50, 52.5, 55, 57.5, 60, 65, 70 and 80 cm below the air-ice interface. The data were recorded at an interval of 2 h. Daily mean, minimum and maximum values of surface brightness temperature and daily maximum and cumulative reflected radiation is shown in Fig. 11 and listed in Table 5. Daily mean, maximum and minimum values of ice/water temperatures obtained with the sixteen thermistors are shown in Fig. 12 and listed in Table 6.

Acknowledgements

We wish to thank all staff at the Chaivo Research Station for their assistance and effort in the field and laboratory and also at the Val Meteorological Station for kindly providing meteorological data. We would also like to express our thanks to staff members of the lighthouse at Chaivo for their help in the field. Special thanks are due to Keiko Ishikawa, Shigeto Mochizuki, Eriko Uematsu and Miyako Yamatani for their assistance in data processing and drawing. Funding for this work was partly obtained from the Japanese Ministry of Education, Science and Culture (Monbusho) through grant-in-aid for the International Scientific Research Program "Sea Ice Studies off the Okhotsk Sea Coast of Sakhalin, Japan-Russia Cooperative Research" (No. 0404I013) and through the Sea Ice Research Laboratory's Overseas Field Work Program.
