— Addendum —

STANDARD MOLAL REAL FREE ENERGIES OF SOLVATION OF INDIVIDUAL IONS AND ELECTROMOTIVE FORCES OF SINGLE ELECTRODES IN NON-AQUEOUS SOLUTIONS

— An Additional Remark —

By

A. MATSUDA*) and R. NOTOYA*)

(Received May 30, 1980)

The values of the standard molal real free energies of solvation α_i°'s of monoatomic ions in non-aqueous solvents at 25°C and those of the standard electromotive forces φ_i°'s referred to the standard state of the gaseous electron at 25°C were estimated in the previous work[1] by an empirical method which was developed on the basis of the standard electromotive forces referred to the standard hydrogen electrode.

In the present addendum article Table II in the previous work[1] in which the values of α_i° and φ_i° for 17 ionic species were listed are supplemented by 54 ionic species for which we have no experimental data of the standard electromotive forces referred to a definite reference electrode in non-aqueous solvents. The values of α_i° and φ_i° for such ions are calculated by Eqs. (14) and (8)

$$z_i F(\varphi_i^\circ - \varphi_{i,aq}^\circ) = \alpha_i^\circ - \alpha_{i,aq}^\circ \cdots (14), \qquad -\frac{1}{z_i}\alpha_i^\circ = \beta x, \cdots (8)$$

using the β-values in Table I in the previous work[1] and $\alpha_{i,aq}^\circ$-values reported in Ref. 2, and are listed in Tables I and II with the symbol # in the present article. For convenience Table II in the previous work are also repeated in these tables (for the symbols *) and **), see Ref. 1).
