Abstract: Direct fluorination of adamantanes was achieved by IF₅ and one or two fluorine atoms were introduced on *tert*-carbons of the adamantanes selectively.

Key words: adamantane, direct fluorination, regioselectivity, hypervalent iodine, iodine pentafluoride

Adamantane (C₁₀H₁₆) is a simple tricyclic cage compound consisting of only two kinds of carbons: four *tert*-carbons and six *sec*-carbons. Adamantane derivatives such as aminoadamantanes are known to have interesting biological properties,¹ and 1-aminoadamantane (amantadine) and 3,5-dimethyl-1-aminoadamantane (memantine) are used as medicines for treating influenza, Parkinson's disease, and Alzheimer's disease. As the introduction of fluorine atoms into bioactive compounds can enhance or modify their activities,² preparation of fluorine derivatives has attracted the attention of organic and medicinal chemists.³ Fluorination of adamantanes has been carried out through the deoxyfluorination of adamantanol,⁴ halogen exchange reaction from other haloadamantanes,⁵ or direct fluorination of the adamantane itself.⁶ Among them, the direct fluorination method is preferable for synthesis of the fluoroadamantanes because its starting materials are easily available. However, for the direct fluorination of the adamantanes, strong oxidizing reagents, such as F₂, are required, which are generally hazardous and require special skill to use. Moreover, their high reactivity causes a low selectivity of the reaction, which makes it difficult to introduce fluorine atoms only at the desired positions by the direct method.^{6a,d,e,g,h} Therefore, a new selective method for the direct fluorination of the adamantanes has been desired.

Equation 1

Recently we found that IF₅ is an effective reagent to introduce fluorine atoms into organosulfur compounds.⁷ During the course of the study, we found that one or two fluorine atoms can be selectively introduced to adamantanes by IF₅ (Equation 1).

When adamantane was allowed to react with excess IF₅ at room temperature, fluorination took place at *tert*-

Table 1 Fluorination of Adamantanes with IF₅^a

Substrate	Conditions	Product	Yield (%) ^b
	0 °C 12h ^c		90
	75 °C 12h ^d		75
	10 °C 12h ^c		85
	80 °C 12h ^d		86
	40 °C 12h		90
	40 °C 12h		90
	40 °C 12h		87
	95 °C 12h ^e		70

^aUnless otherwise stated, the reaction was carried out in CH₂Cl₂ using 3 equiv of IF₅. ^bIsolated yield based on substrate. ^cThe reaction was carried out in CH₂Cl₂ using 0.8 equiv of IF₅. ^d1,2-Dichloroethane was used as solvent. ^eHeptane was used as solvent

carbon selectively to give a mixture of 1-fluoroadamantane **1** and 1,3-difluoroadamantane **2**. Selective preparation of **1** was achieved by carrying out the reaction at 0 °C using 0.8 equiv of IF₅, and **1** was obtained in 90% yield.⁸ On the contrary, **2** was selectively formed by carrying out the reaction at 75 °C using 3 equiv of IF₅. Under the conditions, neither trifluorination of adamantane nor fluorination at *sec*-carbon occurred, and **2** was obtained in 75% yield. Similarly,

from 1,3-dimethyladamantane, 1-fluoro-3,5-dimethyladamantane **3** or 1,3-difluoro-5,7-dimethyladamantane **4** was selectively obtained by carrying out the reaction at 10 °C or 80 °C, respectively. On the other hand, from methyl adamantan-1-carboxylate or 1-acetoxymethyladamantane, only mono-fluorinated product was obtained selectively even at high temperature.⁹ The reaction must proceed through a carbocation intermediate generated by oxidation with IF₅. It was reported that oxidation potential of methyl adamantan-1-carboxylate and 1-acetoxymethyladamantane is comparable to that of 1-fluoroadamantane, and higher than that of adamantane itself.¹⁰ Therefore, introduction of a fluorine atom to them raises their oxidative potentials, and makes it difficult to introduce another fluorine atom to them. Under the conditions, the products were obtained in good yield without influence on the ester group. When 2-adamantanone was used for the reaction, carbonyl group was converted to *gem*-difluoride without fluorination on *tert*-carbon and 2,2-difluoroadamantane **8** was obtained in 70% yield (Table 1).

The IR spectra were recorded using a JASCO FT/IR-410. The ¹H NMR (400 MHz), ¹⁹F NMR (376 MHz), and ¹³C NMR (100 MHz) spectra were recorded in CDCl₃ on a JEOL JNM-A400II FT NMR and the chemical shift, δ, are referred to TMS (¹H, ¹³C) and CFC₃ (¹⁹F), respectively. IF₅ in a stainless-steel cylinder was supplied by Asahi Glass Co., Ltd. From the cylinder, IF₅ was transferred through a Teflon™ tube into a Teflon™ FEP bottle under an N₂ atmosphere. From the bottle to the reaction vessel made of Teflon™ FEP, IF₅ was transferred quickly in open air. IF₅ decomposes in air emitting HF fume, and, therefore, it should be carefully handled in a bench hood with rubber-gloved hands.

1-Fluoroadamantane (1); Typical Procedure

Adamantane (136 mg, 1 mmol), CH₂Cl₂ (2 mL), and IF₅ (178 mg, 0.8 mmol) were introduced into the reaction vessel made of Teflon™ FEP with a tight screw cap at 0 °C and the mixture was stirred at 0 °C for 12h. The mixture was poured into aq NaHCO₃ and extracted with ether (10 mL × 3). The combined organic layer was washed with aq Na₂S₂O₃ and dried over MgSO₄. The purification by column chromatography (silica gel/ hex-

ane:ether = 10:1) gave **1** (139 mg) in 90% yield; white solid; mp 200–204 °C (sealed tube) (lit.^{5a} 210–212 °C).

IR (KBr) 2910, 2855, 1353, 1071 cm⁻¹.

¹H NMR (400 MHz, CDCl₃) δ 2.23 (brs, 3H), 1.90–1.88 (m, 6H), 1.66–1.56 (m, 6H).

¹⁹F NMR (376 MHz, CDCl₃) δ -129.02 to -129.07 (m, 1F) {lit.^{4c} -128.95 to -129.01 (m)}.

¹³C NMR (100MHz, CDCl₃) δ 92.5 (d, ¹J_{C-F} = 182.6 Hz), 42.7 (d, ²J_{C-F} = 17.3 Hz, 3C), 35.8 (d, ⁴J_{C-F} = 2.7 Hz, 3C), 31.5 (d, ³J_{C-F} = 9.3 Hz, 3C).

HRMS (EI) calcd for C₁₀H₁₅F 154.1158, found 154.1159.

1,3-Difluoroadamantane (2)

Adamantane (136 mg, 1 mmol), 1,2-dichloroethane (2 mL), and IF₅ (666 mg, 3 mmol) were introduced into the reaction vessel made of Teflon™ FEP with a tight screw cap and the mixture was stirred at 75 °C for 12h. The mixture was poured into aq NaHCO₃ and extracted with ether (10 mL × 3). The combined organic layer was washed with aq Na₂S₂O₃ and dried over MgSO₄. The purification by column chromatography (silica gel/ hexane:ether = 10:1) gave **2** (129 mg) in 75% yield; white solid; mp 189–190 °C (sealed tube).
