The definition of Phenology

Phenology is the study that records the timing of life cycle events in all living things

Life cycle events are also known as phenophases. In plants, this includes first leaf budburst, first flower, last flower, first ripe fruit, seed dispersal, and leaf colour change, among others

The USA National Phenology Network:

“Phenology is a sensitive measure of climatic variation and change, is relatively simple to record and understand, and is vital to both the scientific and public interest with or without climate change”

Content

- 1. The Linnean time - background from history to present**
2. Finnish National Phenological Network
3. The use of the historical and present phenological data
4. Conclusions

Carl v. Linné

Carl von Linné 1707 – 1778

- ◆ Regarded as ‘the father of phenology’
- ◆ Born in Southern Sweden
- ◆ Professor in Medicine
- ◆ Known best as a naturalist who created the taxonomy of the species

In 1749 asked the public to make phenological observations

In 1751 (*Philosophia Botanica*) Linné advocated that observations of first flowering, leafing, fruiting and leaf-fall should be made all over Sweden, **along with local weather**

Linne's time was also the beginning of Finnish phenology

Finland was – up to 1809 – a part of the Kingdom of Sweden

Since that time phenological recording has continued over centuries in Finland

In 1753 the first phenological dissertation, *Vernatio Arborum*, defended by Harald Barck, was published in the University of Uppsala in Sweden. There were observations from Turku and Pyhäjoki (Finland) and so the phenology in Sweden and in Finland had the same start.

Recording in Finland continued

In 1856 Anders Moberg reported in wide resumé over 20 000 observations (plants, birds etc.) from Finland

“Naturalhistoriska daganteckningar gjorda i Finland åren 1750 – 1845”

The publication based over 20 000 observations!

I	Vexter - <i>Plants</i>	181 species
II	Flyttföglar – <i>Migratory birds</i>	52 species
III	Lektider – <i>Displays, etc.</i>	11 species (1 bird, 1 frog, 9 fishes)
IV	Insekter - <i>Insects</i>	15 species
V	Islossnig – <i>Ice thawing</i>	53 waters bodies
VI	Isläggning - <i>Freezing</i>	38 waters bodies
VII	Första snö om hösten – <i>First snow in Autumn</i>	19 sites

The next slide is an example of this old valuable report

After Harald Barck (1753) and Alexander Malachias (1756) phenological dissertations the next doctoral thesis (1786) based phenological observations made in 1780 – 1785 in Finland

🍃 “*Specimen Calenderii Florae et Faunae Åboensis*”

🍃 After that prof. Hällström in 1844 wrote a manuscript about observations from Brussels to Utsjoki (50°N to 70°N) (unpublished)

The old historical data has afterwards used for different doctoral theses eg. Häkkinen 1999, Linkosalo 2006, Holopainen 2006

on November 24th, 2006, at 12 o'clock*

Publications of the Department of Geology D9
Helsinki 2006

The Finnish National Phenological Network was established 1990's to continue long-term monitoring since 1750's

Phenology is again in the focus from the 1990's because of climate change

Facts in the North:

- Many species are growing in the Northern or Southern limits of distribution; response
- New tools for data processing
- Phenological events and human health
- Phenological events and economy
- Public interest to natural phenomena
- Etc.

2.6 Continuation

Between the long-term voluntary work and a new NPN Oulu University had a great influence

-  Professor Paavo Havas highly recommended to intensify phenological investigation in Finland when it was nearly finished
-  A seminar in Helsinki was organized to add ecological co-operation between universities and research institutes
-  The Finnish Academy supported aims to start phenological recording all over the country at the beginning of 1990's
-  **As a result Finnish National Phenological Network was established by the Finnish Forest Research Institute, Metla, a person in charge Eero Kubin**

Finnish National Phenological Network 1995 -

MONITORING INSTRUCTIONS OF THE FINNISH
NATIONAL PHENOLOGICAL NETWORK

Muhos Research Unit

- Standardized observation guide
- Trained observers
- At least twice per week from the same tree individuals
- Recorded to the database immediately by using internet

4 MONITORED PLANTS AND PHENOMENA

4.1 Downy birch – *Betula pubescens* Ehrh.

Characteristics

Downy birch is smaller in size than Silver birch and its branches are not so thick. The young shoots of the Downy birch are smooth, hairy, and fairly stiff at the tip. Its leaves are usually ovate or roundish in shape, generally with single serration along the edges, and they lack the elongated tip typical of Silver birch. The leaf blade is at its widest at about midway along its length. When compared to the leaf blade, the petiole is shorter and broader than that of Silver birch. The dormant buds are sticky, and the bark at the butt end of the Downy birch is smooth and light in colour.

Mountain birch (*Betula pubescens* ssp. *cherepanovii* Orlova) is a subspecies of the Downy birch. Where Mountain birch occurs, the observations are recorded alongside Downy birch and this is indicated in writing.

Selecting the trees

The observations are made individually by observing five medium-sized and healthy Downy birch trees. The trees have been marked and numbered. All Downy birch observations are made of the same trees.

Phenomena to be monitored

Bud burst. BBCH07.

Leaves are in this phase when they are emerging from their buds. The leaves are still very small, the leaf blade has not yet opened, and the petiole is not visible. This phenomenon is deemed to have occurred when at least half of the leaves of each observation tree have reached this phase, i.e. when the crowns of birches appear green for the first time when viewed from a distance.

Onset of male flowering. BBCH61.

Male flowering is deemed to have begun when the first tree begins to release pollen. This is when the catkins become heavy and start to hang downwards at the tips of branches. In Southern Finland this usually occurs at the end of April, in Central Finland in mid-May, and in Lapland towards the end of May. The beginning of male flowering can be determined by tapping the branches of birches with a long pole or other equivalent.

Leaves full-sized. BBCH15.

The leaf has reached its full size and does not really grow any bigger. The leaves become dark green and thicker, and the foliage of the birch as a whole becomes denser in appearance within a short time. Cross measurements can also be used in connection with this observation by measuring the length and width of a few leaves.

Fig. 1. Male flowering of birch. When the branches are given a tap, the catkins release a distinct puff of pollen. Photos: Eeva Kotilainen

Shedding of seeds. BBCH89.

This phenomenon is deemed to have occurred when the first seeds are observed to be shed by birches. A sheet of plastic or some other suitable material can be spread underneath trees to help in making this observation. In Southern Finland this usually happens already at the end of July or early August; in Northern Finland it happens towards the end of August. The shedding of seeds usually continues well into autumn. If tree-specific shedding of seeds cannot be distinguished, this phenomenon is marked alongside tree no. 1 on the form.

Leaf colouring. BBCH92.

This is the point in time when more than half of the leaves on each observation tree have turned yellow. The discoloration caused by rust fungi is not to be taken as yellowing in the sense meant here. If there is an abundance of birch rust fungi, and this hinders the making of observations, this can be noted down separately. See pictures of birch rust on page 45.

Leaf fall. BBCH97.

The shedding of leaves is deemed to have occurred when more than half of the leaves of each observation tree have been shed.

Fig. 2. Bud burst, leaf colouring and leaf fall of Downy birch. Flushing before the phase of bud burst (A-D); bud burst (E); leaves fully out of the bud (F); leaves full-sized (G); leaf colouring (H); and leaf fall (I). Photos: Eeva Kotilainen.

Metla Oulu

processed into maps and animations available
at Metla's webpage, one of the most visited in Metla
(www.metla.fi/metinfo/fenologia/index-en.htm)

The screenshot displays the MetINFO website interface. At the top, there's a navigation bar with links: Home, Research, Services, Publications, Metafo, Research forests, About the institute, Strategy, and Contact. Below this is a sub-header for 'Metla > Metinfo > Phenology'. The main title is 'MetINFO - Phenological Observations', followed by the subtitle 'Knowledge About the Annual Cycle of Events in Forest Ecosystems'. A sidebar on the left lists various links: Observations, What is Phenology?, Monitoring in Finland, Use of Information, Partners in Co-operation, Oulu Research Unit, and Suomi. The main content area features a series of four images showing the progression of leaf colors from green to yellow. Below these images, there are detailed entries for various tree species and their phenological stages, such as 'Downy birch (Betula pubescens Ehrh.)', 'Silver birch (Betula pendula Roth.)', 'Pine (Pinus sylvestris L.)', 'Aspen (Populus tremula L.)', 'Rowan (Sorbus aucuparia L.)', 'Birch-cherry (Prunus padus L.)', 'Bilberry (Vaccinium myrtillus L.)', 'Cowberry (Vaccinium vitis-idaea L.)', and 'Spruce (Picea abies (L.) Karsten)'. Each entry includes links to 'a series of pictures' or 'animation'. On the right side, there's a section titled 'Real-time knowledge through collaboration involving several organisations, e.g.' with a list of bullet points: 'on the flushing of trees', 'on the height growth of conifers', 'on the onset of autumn colours', and 'on the flowering of cowberry and bilberry and the ripening of wild berries'. Below this is a section for 'ADDITIONAL INFORMATION' mentioning 'Phenology Service: Eero Kuhn, Jarmo Poikolainen, Metla Muhos Research Unit' and 'Berry and Mushroom Crop Forecasts: Kauko Salo, Metla Joensuu Research Unit'. At the bottom, there's a footer with the text 'Updated: 19.03.2012 JKBym | Photo: Erkki Oksanen, Metla, unless otherwise stated | Copyright Metla | Feedback'.

Public use the results

Public and media are interested in timing of phenological events and crop forecasts of forest plants

In 2009 interviews and others 139

E.g. newspaper Lapin Kansa published the maps from our www- pages – figure on the right

Digital photos and animations

28.06.2007

The emerging of the leaves – examples

Downy birch (*Betula pubescens* Ehrh.)

Domestic and international co-operation

Plenty of international and domestic co-operation

Collaborative Action on Nordic Countries—under process

Domestic co-operation with the Finnish Meteorological Institute, universities and other institutes is an essential part of the Network

The observation sites forming the present Finnish National Phenological Network

The weather stations of the Finnish Meteorological Institute

Monitoring networks in Finnish Forests Research Institute, Metla

- Plant phenological network
- ★ Stands for forecast of wildberry and mushroom yields (in addition of phenological network)
- Stands for flowering and seed crops of forest trees

Finnish NPN continuation

-  The research project “Phenology and crop forecasts of forest plants in changing climate” was launched for the years 2009 – 2013. The project will continue ongoing work of the Finnish National Phenological Network
-  The aim is to improve monitoring and definition of the changes of the timing of phenological events and berry and seed crops
-  The correlation between phenological events and climate change will be analysed
-  Domestic and international co-operation, reporting and other forms of dissemination will be continued

Long-term voluntary basic observation and the Finnish National Phenological Network

Figure. Localities for phenological data collection of rowan (*Sorbus aucuparia*) and bird cherry (*Prunus padus*) in Finland in 1752 - 2007.
Terhivuo, J., Kubin, E. & Karhu, J. 2009. Italian Journal of Agrometeorology. 45 - 49 (1) 2009 .

Voluntary observation sites 1752 - 2007

In the next four slides there are results of *Sorbus aucuparia* and *Prunus padus* blooming

(Kubin, Terhivuo and Karhu 2008. Presentation in Rome 2008, COST 725 WG1)

Sorbus aucuparia

Prunus padus

The timing of flowering in bird cherry during the period of 1752 - 2007. $\bullet$ = median of annual observations. Traditional regression model and its 95 % confidence limits have been drawn into the figure. Flowering has been advanced every year 0.05 days since 1973. That is 5 days per one hundred years. **Terhivuo, J., Kubin, E. & Karhu, J. 2009. Phenological observation since the days of Linne in Finland. Italian Journal of Agrometeorology. 45 - 49 (1) 2009 .**

Applied non parametric sen's slope estimate for linear trend is $y = -0,05348 (x - 1752) + 159,9627$. Mann-Kendall test $z = -5.7962$ and significance $< 0,001$. According the model flowering Julian day in 1753 was 162,2 and onward from this to 2007 the flowering happened every year 0.053 days earlier. That is 5,3 days per one hundred years.

Observations made in the Finnish National Phenological Network are in line with long-term recording

The timing of flowering in bird cherry based on the material provided by Finnish National Phenological Network in 1967 - 2008.

Downy birch (*Betula pubescens* Ehrh.)

The emerging of the leaves

Conclusions

The Finnish National Phenological Network is a strong domestic and international collaboration network

The results fit well with many European countries; spring phenophases are coming earlier due to climate warming

Phenophases are more sensitive in northern latitudes

Challenges are organization structure changes and decreasing staff concluding to less phenological stations

Agnowledgement

Our phenology group at Metla Oulu Unit (*Eero Kubin, Jarmo Poikolainen, Jouni Karhu, Jorma Pasanen & Anne Tolvanen*) has done a great work for phenology.

Cooperation with the Finnish Museum of Natural History (*Juhani Terhivuo*) to utilize the old historical data since the Linnean time has given new possibilities to understand long time series

It is highly appreciated those volunteers of many generations carried out observations in the field as well as the office holders of Finnish Museum of Natural History, Finnish Forest Research Institute and other participating units all over the Finland

*Finnish Museum
of Natural History*

METLA

*Finnish Forest
Research Institute*

There are many people involved to the Finnish National Phenological Network. Best thanks especially to field observers!
