IL-34 in the supernatant of chemoresistant lung cancer cells mediates its effects on monocytes differentiation. A, frequencies of $CD14^+CD11b^+$ fraction in total peripheral blood leukocytes (PBLs) treated for 7 days with media or supernatants of chemosensitive (H1299-CS) or chemoresistant (H1299-CR) cells as evaluated by flow cytometry. B, CD68 or CD163 expression in purified $CD14^+$ monocytes cultured in media or in the presence of H1299-CS or H1299-CR supernatants for 7 days as evaluated by flow cytometry. C and D, flow cytometry analysis for HLA-A,B,C, HLA-DR, CD80, CD86 and PD-L1 in purified $CD14^+$ monocytes cultured in the presence of A549 (C) or H1299 (D) supernatants for 7 days. Gray histogram: isotype, black dotted line: monocytes, blue line: supernatant of chemosensitive cancer cells, red line: supernatant of chemoresistant cancer cells. E, comparison of cytokines and chemokines expression between A549-DS and A549-DR cells as evaluated by RT-qPCR. F, ELISA measurement of IL-34 in the supernatants of chemosensitive (H1299-CS) or chemoresistant (H1299-CR) cells as measured in undiluted 72 hours culture. G, purified $CD14^+$ monocytes were cultured in media or in the presence of H1299-CR supernatants pretreated with α-M-CSF, α-IL-34 or control Ig (rabbit polyclonal and mouse IgG1 isotype control) for 7 days. The expression of CD68 or CD163 was evaluated on day 7 by flow cytometry. Large cells were gated based on FSC/SSC. N.D. Not detected.
